REMIT Transaction Reporting User Manual (TRUM)

Version 8.0

29 October 2026

REMIT Transaction Reporting User Manual (TRUM)
Version 8.0

29 October 2026

Please note that the present version of the TRUM, including its Annexes, outlines the instructions for complying with the reporting obligation taking effect on 29 October 2027 as per Commission Implementing Regulation (EU) 2026/256. Consequently, reporting parties are required to continue applying TRUM v. 7.0 for compliance purposes until that date.

1. Introduction and scope

1.1. Legal framework

In December 2011 the European Union adopted a dedicated market integrity and transparency regulation for the gas and electricity wholesale energy markets with an EU-wide monitoring scheme: Regulation (EU) No 1227/2011 ([1]) on wholesale energy market integrity and transparency (REMIT). REMIT introduced a sector-specific framework for the monitoring of EU wholesale energy markets with the objective of detecting and deterring market manipulation. According to Article 8(2) and 8(6) of REMIT, the European Commission shall, by means of implementing acts, adopt uniform rules on the reporting of records of transactions, including orders to trade. The first such implementing act was the Commission REMIT Implementing Regulation (EU) No 1348/2014 ([2]) on data reporting, adopted in December 2014.

Due to the significant evolution of the EU wholesale energy markets since REMIT was first introduced, Regulation (EU) No 1227/2011 was revised in May 2024 via the amending Regulation (EU) 2024/1106 ([3]) (Regulation amending REMIT), expanding the scope of wholesale energy products and effectively introducing a number of additional types of transactions that are to be reported to the EU Agency for the Cooperation of Energy Regulators (ACER) to further enhance and strengthen ACER's effective oversight of wholesale energy markets.

In light of the revision of REMIT, both old and new provisions (e.g. storage contracts for gas and electricity, contracts for balancing markets, reporting of exposures) have been further elaborated in the recast Commission Implementing Regulation (EU) 2026/256 ([4]) (REMIT Implementing Regulation or recast REMIT Implementing Regulation), which replaced REMIT Implementing Regulation (EU) No 1348/2014, and lays down rules for the provision of data to ACER. In particular, the REMIT Implementing Regulation specifies the details of reportable liquefied natural gas (LNG) market data, information relating to the trading of wholesale energy products, and fundamental data. Moreover, it establishes appropriate channels for data reporting and sets out the timing and regularity of data reports.

In consistency with the old provisions, the recast REMIT Implementing Regulation specifies that ACER shall set out the technical details of the reportable information referred to in paragraphs 1, 2 and 3 of Article 7 and in Articles 4, 5 and 6 in a user manual and, after consulting relevant stakeholders and the Commission, make it available to the public upon entry into force of this regulation, pursuant to Article 7(4). The REMIT Implementing Regulation also requires ACER to consult relevant parties and the Commission on material updates of the user manual. On this basis, ACER has developed and published the first version of the Transaction Reporting User Manual (TRUM) on 7 January 2015, which, since its first publication, has undergone several updates in order to accommodate the feedback received from reporting parties and adjust the reporting requirements to the evolution of the EU wholesale energy markets.

EU legislation is legally binding and establishes rights, obligations and requirements that must be complied with by legal or natural persons to which it applies. In the context of transaction reporting under REMIT, reporting parties must submit all reportable information in accordance with the transaction reporting user manual (TRUM), including its annexes, as foreseen in Article 7(4) of Commission Implementing Regulation (EU) 2026/256.

([1]) Regulation (EU) No 1227/2011 of the European Parliament and of the Council of 25 October 2011 on wholesale energy market integrity and transparency (OJ L 326, 8.12.2011, p. 1, ELI: http://data.europa.eu/eli/reg/2011/1227/oj).

([2]) Commission Implementing Regulation (EU) No 1348/2014 of 17 December 2014 on data reporting implementing Article 8(2) and Article 8(6) of Regulation (EU) No 1227/2011 of the European Parliament and of the Council on wholesale energy market integrity and transparency (OJ L 363, 18.12.2014, p. 121, ELI: http://data.europa.eu/eli/reg_impl/2014/1348/oj).

([3]) Regulation (EU) 2024/1106 of the European Parliament and of the Council of 11 April 2024 amending Regulations (EU) No 1227/2011 and (EU) 2019/942 as regards improving the Union's protection against market manipulation on the wholesale energy market (OJ L, 2024/1106, 17.4.2024, ELI: http://data.europa.eu/eli/reg/2024/1106/oj).

([4]) Commission Implementing Regulation (EU) 2026/256 of 30 January 2026 on data reporting implementing Article 7c(2), Article 8(1a), Article 8(2) and Article 8(6) of Regulation (EU) No 1227/2011 of the European Parliament and of the Council on wholesale energy market integrity and transparency and repealing Commission Implementing Regulation (EU) No 1348/2014 (OJ L, 2026/256, 9.4.2026, ELI: http://data.europa.eu/eli/reg_impl/2026/256/oj).

1.2. Scope and purpose

Version 8.0 of the TRUM aims to provide reporting parties with detailed guidance on how to report to ACER transactions relating to wholesale energy products in relation to the supply or storage of electricity, supply of natural gas, along with LNG market data, and the transportation of electricity and natural gas pursuant to the REMIT Implementing Regulation.

The updated and further clarified reporting requirements have served the purpose of improving the quality of the REMIT data, thereby enhancing the market surveillance activities of ACER and the national regulatory authorities (NRAs) under REMIT.

The current version of the TRUM provides guidance on the following ([5]):

- transactions to be reported on a continuous basis pursuant to Article 3(a) and 3(b) of the REMIT Implementing Regulation, more specifically:
    - transactions relating to the supply or storage of electricity and the supply of natural gas, and their derivatives,
    - transactions relating to the transportation of electricity and natural gas, and their derivatives;
- LNG market data to be reported in real time pursuant to Articles 7c and 7d of REMIT and Article 7(2) of the REMIT Implementing Regulation;
- transactions to be reported on a periodic basis relating to the supply or storage of electricity or the supply of natural gas to a single consumption unit with a technical capability to consume 600 GWh/year or more, unless concluded on an organised marketplace (OMP), pursuant to Article 4(2) of the REMIT Implementing Regulation.

The main document of the TRUM is complemented by three annexes, including:

- Annex I on reporting lifecycle events of transactions related to supply contracts;
- Annex II on trading examples related to supply and transportation contracts;
- Annex III on reporting LNG market and trade data.

Reporting parties shall consult the annexes together with this parent document in order to gain a complete understanding of the reporting requirements in place.

The TRUM and its annexes explain the details of the reportable transaction data and LNG market data by providing guidance on how to populate the data fields included in the Annex to the REMIT Implementing Regulation, including the formats and standards that apply to the reporting.

In line with past practices, the TRUM and its annexes will be further updated in subsequent editions on the basis of the experience gained by ACER and NRAs through the implementation of the revised REMIT, including data quality analysis and feedback from market participants, OMPs and registered reporting mechanisms (RRM), often jointly referred to as reporting parties ([6]).

Reporting parties shall note that the TRUM primarily focuses on how to report transactions that are considered reportable under the abovementioned articles of the REMIT Implementing Regulation, while for more information on the scope of the reporting obligations and data reporting rules covered by REMIT and the REMIT Implementing Regulation, the *Guideline on REMIT Transaction Reporting* shall be consulted.

Furthermore, the TRUM does not cover the reporting requirements for exposure, fundamental data and inside information. For further information in that regard, the relevant guidance documents available in the REMIT Documents section on the ACER website shall be consulted.

ACER also stresses that this version of the TRUM does not provide a complete set of the reporting requirements brought by the REMIT Implementing Regulation, rather it focuses on the data types to be

([5]) The reporting guidance provided in the TRUM will be updated in line with the different entry into force of transactions reportable on a continuous, periodic and ad hoc basis pursuant to Article 17 of the REMIT Implementing Regulation.
([6]) See Section 2.2.1 of the *Guideline on REMIT Transaction Reporting*.

reported as of October 2027 (so-called 'first wave'). Additional updates or dedicated guidance documents are expected to be made following the timeline for guidance development foreseen in Article 17 of the REMIT Implementing Regulation.

1.3. Target audience

The TRUM is addressed towards market participants, OMPs and RRMs. ACER expects compliance departments and compliance officers of market participants, OMPs and other entities with transaction reporting responsibilities and third parties acting on their behalf to consult the TRUM and its annexes thoroughly and with careful attention to the provided guidance to ensure the complete, accurate and consistent interpretation and implementation of the described reporting requirements.

1.4. ACER contacts

ACER recommends stakeholders who have questions related to REMIT transaction reporting to submit their questions via ACER's REMIT Query Form available on the REMIT Documents section of the ACER website.

The TRUM and its annexes aim to provide as many reporting scenarios as possible for the population of the different data fields and adequate representation of the different trading arrangements. Nevertheless, the list of examples provided in the guidance documents cannot be exhaustive, therefore, reporting parties shall always contact ACER via its established communication channels in case of any questions or doubt regarding the business and/or technical requirements and correct interpretation of the available guidance to adopt for the reporting of their transaction.

2. Supply contracts to be reported on a continuous basis

According to Article 3(a) of the REMIT Implementing Regulation, the following contracts in relation to the supply or storage of electricity or the supply of natural gas with delivery in the EU, or in relation to the supply, or storage of electricity which may result in delivery in the EU as a result of single day-ahead and intraday coupling, shall be reported to ACER on a continuous basis:

(I) *any transactions related to the supply or storage of electricity or the supply of natural gas, placed or traded in all timeframes, irrespective of whether and how or when they are placed or traded, and regardless of whether they are auctioned or continuously traded;*

(ii) *any transactions related to options, futures, forwards, swaps and any other derivatives relating to electricity or natural gas including contracts-for-difference, irrespective of where and how they are traded.*

For further information on the definition of standard and non-standard contracts, reporting parties shall refer to the Guideline on REMIT Transaction Reporting.

In addition, in Article 7(1)(a) and 7(1)(b) the REMIT Implementing Regulation specifies the format for the reporting as follows:

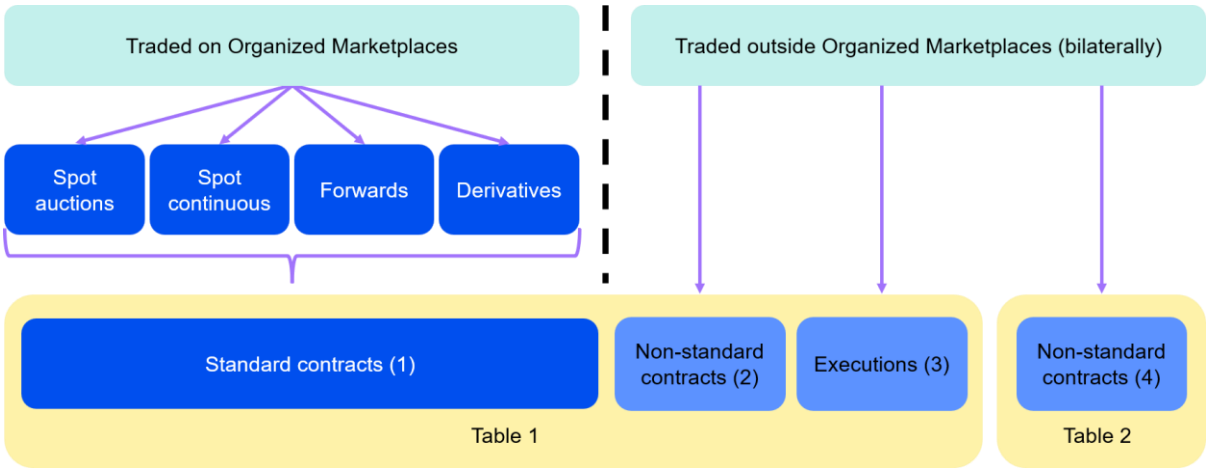

(a) in relation to transactions referring to standard contracts for the supply or storage of electricity or for the supply of natural gas, the details set out in Table 1 of the Annex;

(b) in relation to transactions referring to non-standard contracts for the supply or storage of electricity or for the supply of natural gas, the details set out in Table 2 of the Annex.

Details of transactions concluded within the framework of non-standard contracts, including their execution, specifying at least an outright volume and price shall be reported using Table 1 of the Annex, as set out in Article 7(1).

Figure 1 further aims to clarify the application of Table 1 versus Table 2 depending on the features of the reportable transaction.

Figure 1: Clarification on standard versus non-standard contracts

(1) Standard contracts, defined as contracts admitted to trading on an OMP and that are traded on an OMP, shall be reported in Table 1. Standard contracts typically involve fixed price, quantity and delivery profiles, however, there may be contracts admitted to trade on an OMP that entail some features of non-standardisation, for example including a price formula or volume optionality.

(2) Non-standard contracts agreed bilaterally with a defined price (i.e. outright price, indexed price or price formula ([7])), fixed quantity and fixed delivery profile ([8]) (referred to as bilateral trades), that can refer to standardised or non-standardised products, shall be reported in Table 1. Bilateral trades shall be flagged as 'BILCONTRACT' in Data Field (24) Contract name.

(3) Executions specifying the details of transactions executed within the framework of non-standard contracts previously reported in Table 2, specifying at least an outright volume and price shall be reported in Table 1. Such transactions shall be flagged as 'EXECUTION' in Data Field (24) Contract name and linked to the relevant non-standard contract in Data Field (39) Linked transaction ID by reporting the contract ID of the non-standard contract.

(4) Non-standard contracts agreed bilaterally with fixing events and/or optionality in relation to the price, quantity and/or delivery profile (referred to as 'bilateral contracts') shall be reported in Table 2, by specifying the applicable optionalities and/or fixing events. The related Executions linked to the non-standard contract shall be reported in Table 1.

2.1. Reporting scenarios related to standard contracts

Standard contracts are considered contracts that are admitted to trade on an OMP and shall be reported in Table 1 of the Annex to the REMIT Implementing Regulation. This implies that the features of the contract are pre-specified by the OMP and the contract itself refers to a standardised product in most of the cases. The advertised contract is specific to the given OMP, the contract ID and contract name are assigned by the OMP as well.

The following sections aim to describe the reporting requirements for transactions related to standard contracts traded on an OMP by focusing on the different ways of trading, types of products and contracts, and trading arrangements offered by or available at OMPs featuring the EU wholesale energy markets.

2.1.1. Ways of trading

The trading activity on an OMP might take place either in the form of continuous trading or via auctions, where different price formation mechanisms might apply (namely marginal price or pay as bid). ACER intends to highlight some specificities of the reporting guidance when dealing with transactions that occurred in some of the most liquid market segments.

2.1.1.1. Continuous trading within Single Intraday Coupling

Reporting requirements for the contract ID and contract name

The Single Intraday Coupling (SIDC) is a pan-European electricity market mechanism connecting the national intraday electricity markets allowing continuous trading within a single EU cross-zonal intraday electricity market up to one hour before delivery.

Thus, when a transaction occurs within the SIDC, Data Field (23) Contract ID and Data Field (24) Contract name in Table 1 are expected to have a harmonised structure among different OMPs (being nominated electricity market operators (NEMOs)) that actively join such a market, applicable to both continuous and auction intraday markets within the SIDC.

Therefore, in the case of continuous trading within the SIDC, both Data Field (23) and Data Field (24) shall start with the string 'SIDC_CO_'. In the case of Data Field (23) Contract ID, the prefix 'SIDC_CO_' shall be followed by the contract ID code assigned at the centralised level by the SIDC.

Example

([7]) In case of a price formula, see the related lifecycle related requirement in Data Field (46) in Table 1
([8]) This implies that the trade has no volume optionality for the quantity to be delivered and a predefined fixed delivery point or zone

NEMO 1 and NEMO 2 are both active members in the SIDC (continuous trading), offering their market participants the possibility to join the continuous trading session.

OMP/NEMO 1	Local trading system	Reported via Table 1
Data Field (23) Contract ID	N1234	SIDC_CO_ 35486 _20220805_05_06
Data Field (24) Contract name	NEMO1IDcoupling	SIDC_CO_ NEMO1IDcoupling

OMP/NEMO 2	Local trading system	Reported via Table 1
Data Field (23) Contract ID	IDH03	SIDC_CO_35486_20220805_05_06
Data Field (24) Contract name	IDH03	SIDC_CO_ IDH03

Reporting requirements to uniquely identify the transaction

All transactions in the SIDC receive an identification code from the matching platform. Therefore:

- when reporting orders, the order ID provided by the matching platform when the order is initially submitted shall be reported in Data Field (15) Order ID, by adding the prefix 'XBID_' to the string of the order ID;
- when reporting the resulting trades, the UTI provided by the matching platform shall be reported in Data Field (38) Unique transaction ID, adding the prefix 'XBID_' to the string of the UTI.

In both cases, the transaction timestamp reported in Data Field (37) shall reflect the timestamp provided by the matching platform.

Example

OMP_1 offers to trade SIDC contracts with delivery in the delivery point or zone 10Y——1A. The following orders in the OMP_1 order book are matched, as defined in the trade information.

	Order information			Trade information
Market participant	Local OrderID	SIDC OrderID	Buy/sell side	SIDC UTI
MP_OMP1_1	1234	XBID_9876	B	XBID_58769
MP_OMP1_2	5678	XBID_5432	B	XBID_58781
MP_OMP1_3	9101	XBID_1098	S	XBID_58781

OMP_2 offers to trade SIDC contracts with delivery in the delivery point or zone 10Y——8Z. The following order in the OMP_2 order book is matched, as defined in the trade information.

	Order information			Trade information
Market participant	Local OrderID	SIDC OrderID	Buy/sell side	SIDC UTI
MP_OMP2_1	G857	XBID_7913	S	XBID_58769

For the REMIT data reporting, the cross-border trade identified by the UTI XBID_58769 should be reported as follows.

Buy leg:

Data fields	Field value
Field (1) ID of the market participant or counterparty	MP_OMP1_1
Field (33) Organised marketplace ID/OTC	OMP_1
Field (38) Unique transaction ID	XBID_58769
Field (40) Linked order ID	XBID_9876
Field (78) Delivery point or zone	10Y——1A

Sell leg:

Data fields	Field value
Field (1) ID of the market participant or counterparty	MP_OMP2_1
Field (33) Organised marketplace ID/OTC	OMP_2
Field (38) Unique transaction ID	XBID_58769
Field (40) Linked order ID	XBID_7913
Field (78) Delivery point or zone	10Y——8Z

Reporting requirements for 'batch matching'

Within the SIDC, an increase in cross-border capacity may lead to the coupling of two order books. In such cases, compatible orders initially placed on the individual order books are automatically matched by the trading system via a different matching process (batch matching), which is referred as 'mini-auctions'.

With reference to the reporting of mini-auctions, it is ACER's understanding that the orders maintain the same order ID and are automatically transferred without any action by the market participants to the mini-auction, lasting a few seconds. Such a mini-auction represents a technical solution for the auto-matching system of the orders in the intraday coupling algorithm, but from the data reporting point of view there is no need to report such an event by suspending the continuous session and reporting the orders in the mini-auction with a different contract ID. In such cases it is necessary to flag the trades resulting from such an auto-matching functionality of the intraday coupling algorithm by populating Data field (43) Transaction type with 'BM' for 'batch matching'.

Lifecycle reporting requirements

General reporting requirements for the reporting of lifecycle events of transactions traded on continuous markets shall apply. For further information, see Annex I to the TRUM.

2.1.1.2. Day-ahead auctions within single day-ahead coupling

The Single Day-Ahead Coupling (SDAC) is a pan-European electricity market mechanism connecting the national day-ahead electricity markets into a coordinated auction through a common algorithm.

Reporting requirements for on the contract ID and contract name

Like the reporting requirements provided for transactions placed and concluded within the SIDC, in the case of day-ahead auctions involved in market coupling, both Data Field (23) Contract ID and Data Field (24) Contract name shall start with the prefix 'SDAC_'. In the case of Data Field (23), the prefix shall be followed by the contract ID code assigned at the centralised level by SDAC.

Transaction timestamp

In ACER's view, the transactions timestamp for trades in the case of SDAC shall reflect the time of publication of the global preliminary solution (GlobalPrelimConfirmation) by the NEMO to their market participants, as this represents the moment at which the information on the market result (typically coinciding with the global final solution) is provided to the market participants and can thus be exploited for trading on the wholesale energy market. ACER is aware that the indication of the disclosure of the global preliminary solution might occur differently in every NEMO, which means that the transaction timestamp reported for SDAC will differ depending on the relevant NEMO. In case the global final solution does not coincide with the global preliminary solution, a lifecycle event will have to be reported to ACER.

Price and quantity information for orders and trades

Since in SDAC the market time unit (MTU) defining the granularity/intervals for the trading period specifies quarter-hour blocks (i.e. 15-minute MTU), it is expected that the price information **for trades** resulting from the auction based on the set clearing price reflect the 15-minute granularity. This means that the price of the trade shall be reported by specifying the clearing price in Data Field (87) Price/time interval for each 15-minute MTU (i.e. 15-minute intervals reported in Data Field (84) Load delivery interval) in the *priceIntervalQuantityDetails* section in the TradeList. This requirement shall be respected irrespective of whether the trade refers to a 15-, 30- or 60-minute product.

It is understood that certain auctions markets apply 30-minute granularity/intervals for the trading period (i.e. 30-minute MTU), therefore, in the case of transactions places/concluded in such auctions, the applicable reporting requirements shall follow as described above but applying the 30-minute granularity.

The abovementioned requirement is also considered applicable to orders, provided the reported price information always reflects **the price of the order**.

For the quantity information, the same logic shall be considered applicable as for the price (i.e. it shall follow the granularity of the relevant MTU). For the correct reporting of the total notional contract quantity, see the guidance provided under Data Field (54).

Load delivery intervals for orders and trades

The intervals reported in Data Field (84) Load delivery interval **shall always indicate the date and time** of the interval for both orders and trades. In addition, the intervals shall always be reported in a chronological order, with each consecutive interval relevant to the order and trade. This means that grouping together several non-consecutive intervals that have the same price and/or quantity is not allowed. In the case of aggregated curves, the price shall determine the order of the intervals in an ascending manner (lowest to highest).

The Contract List shall reflect whether the product is a 30-minute or 60-minute product by reporting the deliveryStartDateTime and deliveryEndDateTime, along with the loadDeliveryStartDateTime and loadDeliveryEndDateTime with the delivery interval of the product (i.e. 30- or 60-minute).

Lifecycle reporting requirements

For the reporting requirements of lifecycle events in relation to transactions placed and concluded on auction markets, see Annex I to the TRUM.

2.1.1.3. Intraday auctions within SIDC

By adopting a similar approach to the one described for transactions in SDAC, when trading at intraday auctions (IDAs) within SIDC, both Data Field (21) and (22) shall start with one of the applicable strings specified below, depending on which auction session the contract refers to. This means that the following prefixes shall be used respectively:

- 'SIDC_IDA1_' for contracts offered in the intraday auction taking place on D-1 at 15:00;
- 'SIDC_IDA2_' for contracts offered in the intraday auction taking place on D-1 at 22:00;
- 'SIDC_IDA3_' for contracts offered in the intraday auction taking place on D at 10:00.

In Data Field (23) Contract ID the applicable prefix (e.g. SIDC_IDA3_) shall be followed by the contract ID code assigned by the relevant OMP.

With regards to the reporting of the granularity of the orders, the same requirements as specified for orders placed within SDAC shall be considered applicable (see Section 2.1.1.2). In addition, the transaction timestamp for trades concluded within IDAs is considered the same as described for SDAC in Section 2.1.1.2.

2.1.1.4. Pay-as-bid auctions

It is ACER's understanding that in pay-as-bid auctions the transmission system operator (TSO) simultaneously acts as a market participant on the buy side and as an OMP, by facilitating that multiple third-party buying or selling interests in wholesale energy products interact in a manner that may result in a transaction.

In the REMIT reporting, in the case of such a pay-as-bid auction, the TSO's demand side is expected to be reflected in the form of an order report (buy side order), by using Table 1, even though it does not fully reflect the actual market activity in the sense that the TSO's order was not entered into the order book.

In doing so, in the TSO's order report Data Field (1) ID of the market participant shall identify the relevant TSO with one of the accepted codes registered in the Centralised European Register of Energy Market

Participants (CEREMP), and an order ID shall be artificially assigned to the TSO's (buy) order and reported in Data Field (15) Order ID.

The transaction timestamp of the TSO's (buy) order is expected to be the time of the gate closure.

In the case of pay-as-bid auctions, Data Field (25) Contract type shall be populated with value 'AU_PAB' for the reported orders and trades linked to the auction.

2.1.2. Trading arrangements

2.1.2.1. Direct electronic access

Market participants may enter into transactions on organised marketplaces by acting on the account of a third-party by the means of direct electronic access (DEA)([9]). Hence, in case the transactions placed or concluded under a DEA arrangement are to be reported under REMIT, Table 1 shall be used.

While in general it is understood that the reporting requirements described in the TRUM for transactions placed or concluded on an OMP under a DEA arrangement shall not differ from those applicable for any other OMP transaction, it is crucial to correctly identify in the transaction report the parties involved in the 'DEA chain'.

More specifically, the DEA chain always involves the DEA provider (being the exchange member and owner of the trading account) and the DEA client acquiring access to the DEA provider's account through direct delegation. In addition, in some cases the DEA chain may include sub-delegation. The DEA client or the sub-delegated client(s) may place or conclude the transaction on its own behalf or on behalf of a final beneficiary.

While the below sections aim to clarify the general principle and understanding over the role of the different parties involved in the DEA chain and the respective transaction reporting requirements, more detailed guidance on the reporting is available under Data Fields (9), (10) and (12).

DEA Provider

When the DEA provider offers the DEA service to the DEA client to trade on an OMP, this means that the transactions are placed or concluded by the DEA client via the account of the DEA provider. Since the DEA provider is the registered member of the OMP, it is considered a market participant under REMIT (given that it bears responsibility for the trading activity), hence shall be identified in Data Field (1) ID of the market participant or counterparty via one of its unique codes registered in CEREMP. This does not necessarily imply that the DEA provider is the decision maker, but it is responsible towards the OMP.

DEA client

When a DEA client uses the account of the DEA provider for its trading activity, it is understood that the DEA client enters into transactions by acting on the account of the DEA provider ([10]). Therefore, in this scenario the DEA client is a market participant under REMIT and must be identified in Data Field (9) ID of the market participants acting on a third-party account via one of its unique codes registered in CEREMP. When using the account of the DEA provider, the DEA client may enter into transactions on its own behalf or on behalf of a final beneficiary.

Given that the DEA provider is the registered member of the OMP, and the DEA provider and the DEA client are in a direct contractual relationship, both the DEA provider and its client shall ensure that the DEA client is correctly identified towards the OMP at transaction level in the REMIT reporting.

Sub-delegation

Depending on the business model established for a given DEA service agreement, the DEA client (client 1) may be allowed by the DEA provider to sub-delegate the DEA provider's trading account to a sub-delegated client (client 2). Under such a scenario, it is understood that the DEA client (client 1) is in a

([9]) For the definition of direct electronic access, see Article 2(19) of REMIT
([10]) Note that this scenario refers to the case when there is no sub-delegation in place

direct contractual relationship with both the DEA provider and also with the DEA sub-delegated client (client 2), therefore, client 1 is considered as an *intermediate beneficiary* ([11]) towards the DEA provider.

In such configuration, the sub-delegated client (Client 2) that is effectively using the DEA provider's account to trade on the OMP is considered a REMIT market participant given the fact that it is entering into transactions on a wholesale energy market. Hence, it shall be registered with the relevant NRA pursuant to Article 9 of REMIT. The sub-delegated client (client 2) may carry out its trading activity on its own behalf or on behalf of a final beneficiary.

Regarding the REMIT reporting requirements in case of sub-delegation, the DEA client (client 1) that is passing further the trading account to client 2 shall always appear in Data Field (9) given that towards the DEA provider client 1 is considered an intermediate beneficiary, as per Article 8(1) of REMIT.

In addition to the ID of the DEA client, also the sub-delegated client (client 2), being a market participant when using the account of the DEA provider for placing or concluding the transaction, is to be identified in Data Field (9). It is understood that in certain arrangements, such reporting may not be permittable at a transaction reporting level due to confidentiality restrictions within the DEA chain, nevertheless, the sub-delegated client (client 2) placing or concluding the transaction shall still comply with its registration obligation under Article 9 of REMIT.

If the information on the sub-delegated client (client 2) placing or concluding the transaction is known by the OMP either at the time the reporting is due or afterwards, Data Field (9) should be reported, respectively, either in the record with Action type N or as its modification with Action type M, with the corresponding ID of the client (where contractually permitted).

Furthermore, at the schema level the applicable <deaSubdelegation> flag (being a mandatory field) shall be populated with value 'true' in case of sub-delegation. The information on the sub-delegation is expected to be communicated towards the OMP by the DEA client (client 1) directly, if applicable, or via the DEA provider.

Final beneficiary

As explained above, the correct representation of the different entities involved in the DEA is essential. In a similar fashion, pursuant to Article 8(1) of REMIT, the correct identification of the *final beneficiary* is also of key importance in the REMIT transaction reporting.

Data Field (10) Beneficiary ID shall identify the final beneficiary of the transaction when the beneficiary is not the same as the market participant identified in Data Field (1) or in Data Field (9). In general, the OMP shall report the final beneficiary information once it is available to the OMP, and this should apply also in case the reportable transaction was placed or concluded under a DEA arrangement.

As mentioned above, it might be the case that the sub-delegated client (client 2) carries out the trading activity on its own behalf, but it cannot be identified in Data Field (9) since this information may not be available to the OMP. Nevertheless, the final beneficiary information shall still be reported by the OMP in the record reported with Action type N or, once known, as a modification with Action type M, even if the final beneficiary may be the sub-delegated client (client 2) that was actually trading on its own behalf (hence it should have been identified in Data Field (9)).

The ID of the sub-delegated client (client 2) is expected be reported as a modification in Data Field (9) with Action type M once it becomes available to the OMP, if contractually permittable, irrespective of whether the sub-delegated client (client 2) has been identified earlier in the record as a final beneficiary in Data Field (10).

Ensuring the identification of the final beneficiary in the transaction report (latest as a lifecycle event) is the responsibility of the market participant trading on behalf of the final beneficiary, if this information is not known by the OMP.

([11]) Article 8(1) of REMIT specifies that information reported within a record of wholesale energy market transactions shall include, inter alia, the intermediate or final beneficiaries of the transaction.

2.1.2.2. Trading on an exchange with orders placed on a broker platform

If the trade takes place on an exchange with the related orders placed on a broker-type OMP (i.e. via screen or voice-assisted), the resulting trade should be reported as any other trade that takes place on an exchange.

If traded on the broker's screen, the orders should be reported to reflect that the orders were placed on a contract advertised by the exchange. There is no expectation that the order report and the trade report are linked together as they were placed first and executed later on two different OMPs. When orders on futures traded on exchanges are placed on the broker platforms, for example indication of interest (IOI), Data Field (6) ID of the other market participant (counterparty) should include the ID of the exchange.

This can be reported in the form of the legal entity identifier (LEI), bank identifier code (BIC), energy identification code (EIC), ACER code or market identifier code (MIC) code.

2.1.2.3. Click & Trade

It is ACER's understanding that a Click & Trade order is a limit order which aggresses the initiator order.

In the case of Click & Trade, ACER shall receive two trade reports (buy and sell side) and only one order report in the event that the trade fully extinguishes the initiating order.

The initiator shall report an order and a trade populating Data Field (14) with 'I' for 'Initiator' and Data Field (16) Order type with 'LIM', while the aggressor aggressing the initiator's order shall report the trade by populating the tag 'clickAndTradeDetails' in the Trade List of the electronic format with the information on the order of the initiator.

It is understood that the conclusion of the trade takes place on the OMP, therefore, the order record and the resulted trade records (for the two sides) are expected to be reported by the OMP.

It may happen that some trading systems automatically create the order for the aggressor when a Click & Trade takes place. In this case, when reporting Click & Trade transactions, the reporting party can decide to also report the aggressor's order.

2.1.2.4. Clearing and trade registration

With reference to the clearing (or registration) of a trade concluded bilaterally or on a broker-type OMP, the cleared/registered trade shall be reported to ACER by the clearing exchange OMP indicating the following information in the trade report.

- Data Field (33) Organised marketplace ID/OTC shall be populated with the unique code of the exchange where the trade is cleared/registered.
    - In addition, the exchange is expected to flag whether the original trade (agreement) which was subsequently sent for clearing was concluded on a broker-type OMP or bilaterally. This means that the registered identification code of broker-type OMP or value 'XBIL' respectively shall be populated in the dedicated schema field <sourceOMPID> in the Trade List.
- Data Field (37) Transaction timestamp shall indicate the timestamp of the clearing/trade registration.
- Data Field (40) Linked order ID shall be reported with the default value 'NA'.
- Data Field (43) Transaction type shall be populated with 'CL' for 'Cleared' in order to flag the cleared trade.
- There is no requirement that the original trade (that was agreed bilaterally or concluded on a broker-type OMP) and the cleared trade reports are linked together in the REMIT reporting, however, reporting parties may establish such linkage in their reporting.

If the original trade that was subsequently sent for clearing (trade registration) was concluded on a broker-type OMP, the related orders and the resulting trade (including their lifecycle events taking place on the OMP) are considered reportable by the broker-type OMP.

It is important to note that when the clearing occurs, the original transactions reported shall **not** be cancelled with Action type C as a lifecycle event.

If the trade was originally agreed bilaterally, it is expected to be reported as a bilateral trade by the relevant market participants as the counterparties, provided the bilateral trade represents a firm trade at the time of the agreement. In case the bilateral trade becomes firm only upon clearing/trade registration, the original bilateral agreement is not considered a reportable transaction.

It may also happen that the trade registered by the exchange for clearing refers to two separate trades concluded by the same counterparties on the broker-type OMPs.

For example:

1. trade 1: on 15 August, market participant A executes on a broker platform a transaction with market participant B for a volume V1 and price P1;
2. trade 2: on 17 August, the same market participants execute another transaction on a broker platform for a volume V2 and price P2;
3. trade 3: on 20 August, market participant A registers at the exchange for clearing purpose an OTC transaction with market participant B for volume $V = V1 + V2$ and at a price of P (potentially different from P1 or P2).

In such a scenario, Trade 1 and Trade 2 are expected to be reported by the broker-type OMP by indicating the ID of the broker-type OMP in Data Field (33), by reporting the respective price and quantity information and being assigned with different UTIs. On the other hand, Trade 3 is expected to be reported by the exchange OMP that has registered the trade by reporting volume V and price P in the trade reporting (together with the information the clearing exchange is required to report as described above).

2.1.3. Type of products and contracts

2.1.3.1. Trade at settlement

Trade at settlement (TAS) is considered a type of order that allows a trader to enter an order to buy or sell an eligible futures contract during the course of the trading day at a price equal to the settlement price for that contract, or at a differential price range, for instance for up to five ticks (+/– minimum price fluctuations) above or below the settlement price. The key difference from a normal order is that the TAS order price is defined by the next settlement price +/–, i.e. the agreed difference with the settlement price.

An example is the following: a TTF with TAS order will be entered in the order book with a price of EUR 0.015 at 09:30. The price of this order is updated up to EUR 0.020 at 09:40. Then, the order is lifted at 09:45. At 17:15, the settlement price (EUR 47.23) is calculated and as result of that settlement price the trade price is defined as EUR 47.25.

In the case of TAS orders and trades, it is understood that the price of an order represents a differential price range above or below the settlement price. Therefore, the following requirements shall be met when reporting the transaction related to TAS:

- Data Field (27) Fixing index or reference price shall indicate the reference to the settlement price;
- Data Field (45) Price is not applicable;
- Data Field (46) Price formula shall represent the price difference compared to the settlement price in the order report and the trade report;
- Field (49) Price currency and unit shall indicate the currency of the settlement price.

As TAS orders can result in future or forward contracts, Data Field (25) Contract type is to be populated with 'FU' or 'FW' respectively.

2.1.3.2. Local flexibility products

In the context of transaction reporting, the following scenario and reporting requirements are to be considered regarding local flexibility products.

Scenario: the exchange decides to offer the possibility to trade local flexibility products. The platform offered by the exchange is used by, on the buy side, the TSO / distribution system operator (via the system operator) to access the liquidity of the exchange to coordinate their congestion management solutions, and, on the sell side, the exchange members. Despite the presence of an aggregator (i.e. the system operator) with the function of reducing congestion in the electricity grid, this arrangement represents the bringing together of multiple third-party buying and selling interests in wholesale energy products in a way that results in a contract. Therefore, such contracts are considered as standard contracts traded on an OMP, having both the orders and trades to be reported by using Table 1.

When reporting the transactions in Table 1, the following requirements shall be met.

- Both Data Field (23) Contract ID and Data Field (24) Contract name shall start with the prefix 'CM_', followed by the contract ID and contract name, respectively, assigned by the OMP. The prefix 'CM' shall stand for 'Congestion Management'.
- Data Field (33) Organised marketplace ID/OTC shall identify the OMP on which the order was placed, and the trade was concluded related to the local flexibility product.
- Data Field (78) Delivery point or zone shall be populated with the EIC of the relevant balancing zone or market area for delivery, and the relevant EAN code to indicate the locational information via the unique identification number that links the respective connection point to a specific user/address.

2.1.3.3. Gas within-day contracts

It is understood that within-day contracts for the supply of natural gas feature a delivery time covering the remainder of the current gas delivery day at the time the trade is concluded.

In ACER's understanding there are some European countries where gas within-day contracts can be delivered from 06:00 am to 06:00 am of the following day (daily balancing), while in other European countries there are 24 tradable contracts, one for each hour from 06:00 am to 06:00 am of the following day (hourly balancing).

When a within-day contract features daily balancing in its contract specification, the relevant order and trade records are expected to refer to 06:00 am to 06:00 am of the following day in the delivery profile in their contract details, while the load delivery intervals in the *priceIntervalQuantityDetails* section shall be populated with the actual hours of delivery (i.e. the remaining hours until the end of the gas day). It is expected that the order and the related trade record refer to the same contract ID reported in Data Field (23). For further information, see Example 2.20 in Annex II to the TRUM.

On the other hand, if the within-day contract traded on an exchange encompasses hourly contracts (hourly balancing), each contract shall be assigned with a different contract ID. In this case, the applied reporting logic is the same as for most of the hourly electricity contracts represented in Annex II to the TRUM. However, in some circumstances, for example when gas within-day contracts are traded on broker platforms and are related to markets with hourly balancing, this may be handled differently.

2.2. Reporting scenarios related to non-standard contracts

2.2.1. Features of a non-standard contract

In ACER's understanding, the typical structure of non-standard contracts for the supply or storage of electricity or the supply of natural gas may include:

- general or master agreement ('main body');
- election sheet;
- annexes (part of the general agreement by default); and
- individual transactions (constituting the economic terms) precisely defining the energy-related contract.

Master agreements typically serve the purpose of setting out the rules for trading activities of the two counterparties of a contract, but do not set any obligation on the two parties. The conclusion of such a general agreement (e.g. general agreement for the **delivery and acceptance of electricity**) setting out the general terms for trading without specifying the price setting of volume optionality, for example, the amount of electricity, time and place of delivery and price, is not a reportable contract under REMIT. However, the individual contracts concluded under the terms of a general agreement concerning the **delivery and acceptance of electricity** shall be reported.

Other master agreements may not include some of the parts indicated above but are general contracts for the supply of electricity or natural gas that have two main parts: a commercial part and an economic part. If market participants have agreed on the commercial terms under a general agreement, they may:

1. negotiate the economic terms and conclude a trade (commercial and economic terms), which will result in a bilateral trade reportable in Table 1; or

2. negotiate the economic terms and conclude a contract (commercial and economic terms) with flexibility, which will result in a non-standard contract reportable in Table 2 (price and quantity may change at a later stage).

Alternatively, depending on the agreement, market participants may have already agreed the commercial and economic terms in one agreement (contract) which includes non-standard contract clauses, such as take or pay and/or reselling of already purchased quantities and/or different pre-defined pricing formulas. Under such a contract, which is considered a REMIT non-standard contract reportable in Table 2, the following features apply:

- quantities are not necessarily pre-defined;

- the price is pre-defined (e.g. by formula or index) but may not be fixed; and

- at least one of the market participants is obliged to deliver/offtake agreed quantity or has the single right to request this from the other market participant.

Under this type of agreement there may be different nomination, pricing flexibility, option exercise and possibility to enter into forward contracts or additional volumes.

Under such a Table 2 non-standard contract, market participants may do the following.

1. Negotiate the economic terms and conclude a trade considered as bilateral trade reportable in Table 1 under REMIT. In such a case, the contract name reported in Data Field (24) shall be populated with the default value 'BILCONTRACT' and Data Field (39) Linked Transaction ID shall include the contract ID of the non-standard contract reported in Table 2.

   Or

2. Conclude executions under the framework of the non-standard contract using the flexibility and fixing events, considered as executions reported in Table 1 under REMIT. In such a case, the contract name reported in Data Field (24) shall be populated with the default value 'EXECUTION' and Data Field (39) Linked Transaction ID shall include the contract ID of the non-standard contract reported in Table 2. Each execution report shall be assigned with a unique transaction identification in Data Field (38) Unique Transaction ID of Table 1.

Executions

In the context of REMIT transaction reporting, execution shall be understood as executed deliveries concluded under a non-standard contract previously reported in Table 2. Executions shall be reported in Table 1 when the outright price and quantity of the execution are available and are linked to the relevant non-standard contract (hence they may also be called 'invoiced' executions).

In the case of executions, ACER understands that once the volume and the price of the transaction is known to the counterparties, the transaction is complete. This can occur after the delivery of the commodity. In the context of executions, each exercise of the contractual right to deliver the agreed energy in an EU delivery point or zone is a reportable transaction. When reporting executions, the relevant delivery point or zone shall be identified in Data Field (78) according to ACER's list of accepted EICs available on the REMIT Portal.

It is important to note some nuances between a physical spot/forward contract traded on an OMP with a price settled against an index and an execution under the framework of a non-standard contract which settles days after the delivery of the energy commodity ends. In fact, both two transactions may not have a fixed price or volume before the delivery of the energy commodity starts and, most likely, both of them will be completely settled after the delivery period ends. However, while the physical spot/forward contract traded on an OMP is reported with the contracted volume and the fixing index (which most likely is publicly available), the transaction executed under the framework of a non-standard contract has to be reported once the delivered quantity and the price are known. Therefore, the date and time of the two execution records reported by the counterparties may be different.

ACER understands that the details of transactions executed within the framework of non-standard contracts are available to both parties to the contract by the invoicing date at the latest. On that basis, executions under the framework of non-standard contracts are reportable no later than 10 working days after the invoicing date at the latest. In ACER's understanding this implies that the billing cycle and invoicing date is the last point in time when the price and quantity can be discovered. However, in the context of the **billing cycle** and the **invoicing date**, the different components of the invoice, such as taxes, costs and different adjustments, are not in the scope of REMIT. Market participants shall report the energy price for the energy delivered in the period the reported execution refers to.

Market participants reporting transactions executed within the framework of non-standard contracts should report the energy price as considered in the contract. If the price is fixed, that outright price is expected to be reported. If the price is fixed by a fixing index, a price formula defined in the contract or a strike price in the case of option contracts, then that energy price must be reported in the execution report. Regarding the energy delivered, market participants shall report the energy delivered as indicated in the execution report.

ACER understands that invoices may cover several months: the current month plus some adjustments from previous months (these can sometimes go back up to several months in the past). Market participants have to report only the energy delivered in the period the execution report refers to without any adjustments from the past. If the reporting of the energy delivered in the previous month is overestimated or underestimated, nothing would prevent market participants updating the previously reported execution report with Action type M as lifecycle.

When executions under the framework of a non-standard contract have a price which is set with different price formulas depending on the delivery point of the commodity, then these executions should be reported separately (one report for each delivery point). If the price is set with one price formula for all the delivery points of the commodity, and the volume split is known to the market participant, then these executions should be reported separately (one report for each delivery point). If the volume split is not known to the market participant, then these executions can be reported with one report (e.g. one report indicating the total volume and indicating, for example, two delivery points).

It is also important to note that within the framework of a non-standard contract, for those periods when there is no delivery, there is no need to report executions. In addition, where the framework of a non-standard contract allows for the sale and purchase of energy under the same contract, market participants shall **not** net those executions, as in some circumstances they may lead to zero volume at the end of the month. Market participants need to report the sold and bought volumes separately with different execution reports in Table 1.

ACER understands that there are contracts with a joint venture of producers of certain fields. In the case of such joint ventures there are separate contracts with each of the parties participating in that field, but that invoicing is done with only one partner, often referred to as 'the operator' of the field. In such cases, in the context of reporting the executions, those contracts should be reported separately, allocating the delivered volume to the respective contracts (counterparties) and reporting as many transactions as the number of counterparties to contracts related to the same gas field.

2.2.2. Power purchase agreements

It is ACER's understanding that power purchase agreements (PPAs) are typically bilateral, non-standardised forward contracts entailing features of price, volume and/or delivery optionality, therefore such contracts shall be reported in Table 2, with the related executions in Table 1 where the outright volume and price shall be specified.

When reporting a non-standard contract as a PPA in Table 2, market participants shall populate Data Field (12) Contract type with one of the values only applicable to PPAs, such as FW_PPA, in order to flag in the REMIT reporting that the contract refers to a PPA.

In order for market participants to identify whether the non-standard contract they need to report under REMIT should be considered and flagged as a PPA, it is recommended to refer to Article 2(77) of Regulation (EU) 2019/943 ([12]) of the European Parliament and of the Council for the definition of a PPA: 'a contract under which a natural or legal person agrees to purchase electricity from an electricity producer on a market basis'. In addition, market participants may consider the following non-exhaustive list of the most common, general features of a typical PPA, such as:

- longer term delivery period;
- direct link to one or more generation plant(s);
- sell side: power producer / generator or a distributor (for latter, the contract explicitly refers to a electricity generation plant);
- buy side: offtaker (it may be a distributor);
- additional underlying mechanism;
- predefined commercial conditions including pricing, delivery point, billing and payment conditions.

When reporting PPAs in Table 2, reporting entities shall consider the population of the dedicated data fields related to PPAs such as Data Field (15) Type of generation asset, Data Field (16) Underlying mechanisms, if applicable, and Data Field (17) Type of Power Purchase Agreement (PPA).

([12]) Regulation (EU) 2019/943 of the European Parliament and of the Council of 5 June 2019 on the internal market for electricity (recast) (OJ L 158, 14.6.2019, p. 54, ELI: http://data.europa.eu/eli/reg/2019/943/2024-07-16).

Market participants are expected to consult Annex II to the TRUM for examples on reporting PPAs using Table 2 and their executions in Table 1, along with Annex I to the TRUM for the lifecycle reporting requirements applicable to non-standard contracts.

Baseload PPAs with a fixed quantity and delivery profile may be reported in Table 1, provided the relevant fields identifying the transaction as a PPA are populated consistently with its baseload volume profile.

2.2.3. LNG portfolio-type contracts

Portfolio-type contracts concluded between the counterparties for the delivery of LNG shall not be considered the same as the general/master agreements described in Section 2.2.1. Portfolio-type contracts are defined as short-, mid- or long-term binding agreements between the counterparties, typically including:

- pre-defined pricing formulas (typically expressed as complex price formula);
- pre-defined (but not necessarily fully fixed) quantities or number of cargos to be delivered under the portfolio; and/or
- other flexibility and optionality clauses.

Under portfolio-type contracts, the counterparties subsequently agree on cargo nominations to fulfil their delivery obligation, which will result in the execution/individual delivery of the cargo(s) at the agreed LNG terminal.

Given the different flexibilities and optionalities that portfolio-type contracts typically include, they are considered non-standard contracts to be reported in Table 2 under the REMIT transaction reporting framework but are **not** considered reportable as LNG market data. Cargo nominations under portfolio-type contracts specifying the delivery of LNG in the EU are, however, considered reportable as LNG market data in the dedicated REMITTable1LNG schema, therefore Annex III to the TRUM on reporting LNG market and trade data shall be consulted.

The LNG market data for cargo nominations reported in the REMITTable1LNG schema shall always provide the contract ID of the related non-standard contract previously reported in Table 2. In case the LNG market data record on cargo nomination is reported earlier than the first Table 2 record with Action type N for the portfolio-type contract (this may happen given the different reporting timelines), the contract ID of the portfolio-type contract may need to be reported as a lifecycle event to the LNG market data record.

LNG supply contracts can be concluded based on two distinct delivery terms, i.e. on DES (delivery-ex-ship) or FOB (free-on-board) basis. Therefore, the delivery terms of the LNG portfolio-type contract reported in Table 2 shall always be specified in Data Field (18) Delivery terms.

If the portfolio-type contract does not specify any (fixed or potential) EU delivery, the contract is not reportable under REMIT at the time of the agreement. If there is a later decision to deliver LNG in the EU, the portfolio-type contract becomes reportable in Table 2 in T + 10 working days from the day the delivery into the EU was agreed by indicating the terms and conditions of the contract relevant for EU deliveries. The Table 2 report shall indicate the EIC code of the agreed EU delivery terminal, but the economic terms shall reflect the optionality and flexibilities included in the original contract. It is important to note that the actual cargo nominations are reportable in real time as LNG market data upon the agreement on the delivery.

In case the portfolio-type contract (with volume, price and/or delivery window optionality) specifies EU delivery but without the actual EU LNG terminal(s) where the delivery shall happen, it is to be reported as a non-standard contract in Table 2 by indicating the delivery point with EIC 21W000000ACELNGX, which represents all LNG terminals located in the EU. Later when the specific EU LNG terminal where the cargo shall arrive is agreed between the counterparties, the agreement becomes reportable as LNG market data related to the cargo nomination and it shall indicate the EIC of the actual LNG terminal where the cargo delivery will take place.

If the portfolio-type contract specifies the optionality to deliver the commodity at more than one EU LNG terminal or/and other terminals outside the EU, the LNG market participant shall report the contract in Table 2 by including all the EIC W codes related to EU LNG terminals in the report. The agreed cargo nominations are reportable as LNG market data.

Market participants are expected to consult Annex II to the TRUM on examples for reporting LNG portfolio-type non-standard contracts using Table 2, and Annex I to the TRUM for the lifecycle reporting requirements applicable to non-standard contracts.

For further information on the reporting requirements for LNG market data, see Chapter 5 of the TRUM and also Annex III to the TRUM, in particular.

2.3. Delivery point or zone for supply contracts

The accurate identification of the delivery point or zone of the supply contract in the reported transaction report is a fundamental requirement in the transaction reporting guidance under REMIT and is mandatory information for all transactions reported in Table 1 and Table 2 in Data Field (78) and Data Field (46) respectively. These fields shall indicate the EIC Y, Z or W code to identify the delivery point or zone for the contract.

Any contract related to the supply of electricity or natural gas, irrespective of whether it is a spot, a physical forward, a future or an option contract, has a reference to a delivery point or zone. Also, financial derivatives related to EU electricity or gas have a reference price or other attributes that relate to the delivery of the commodity.

ACER publishes and updates on a regular basis the list of accepted EICs for REMIT transaction reporting purposes on the ACER website. The transaction reports reported with an EIC in Data Field (78) and (46) in Table 1 and Table 2 respectively that is not included in the list will be rejected by the relevant validation rule. Additional codes that represent delivery points for REMIT transaction reporting purposes not currently listed should be conveyed to the online EICs Reporting Form.

Electricity delivery point or zone

The delivery point or zone of a contract for the supply of electricity can be of two types.

1. **Balancing zone.** This is the zone for which the system operator is responsible for keeping the electricity in balance. Market participants will deliver and take the delivery (transfer of ownership of the commodity) of the electricity through their nominations, for example, the notification of the electricity delivered or withdrawn into or from the system to the system operator.
2. **Market area.** This is the area that the specific contract refers to. It can be the same as the balancing area, or it can encompass several balancing areas.

Gas delivery point or zone

The delivery point or zone of a contract for the supply of gas can be of four types.

1. **Balancing zone.** This is the zone for which the system operator is responsible for keeping the gas in balance. Market participants will deliver and take the delivery (transfer of ownership of the commodity) of the gas through their nominations, for example, the notification of the gas delivered or withdrawn into or from the system to the system operator.
2. **Market area**. This is the area that the specific contract refers to. It can be the same as the balancing area, or it can encompass several balancing areas.
3. **Interconnection or entry point.** These points can be defined as follows.
    a. The interconnection point is the point where gas is delivered and then transferred to the other side of the interconnection point by the system operator. This case applies to **unbundled interconnection capacity only**. For example, interconnection between area (A), managed by system operator (TSO_X), and area (B), managed by the neighbouring system operator (TSO_Y), which can be explained as follows.
        i. Market participant (MP1) delivers and balances its position at point (A) with TSO_X. Market participant (MP1) makes its nomination at point (A) with TSO_X.

ii. The system operators TSO_X and TSO_Y transfer the energy from point (A) to point (B).

iii. Market participant (MP2) delivers the gas and balances its position at point (B) with TSO_Y while the market participant (MP2) makes the nomination at point (B).

iv. Delivery at interconnection points across two EU Member States must be reported only in the case of unbundled capacity. In all other cases the balancing zone or market area should be reported (see point 3(a)) above.

v. Delivery at interconnection points across a non-EU country and an EU Member State with unbundled capacity must be reported only in case of flow in the direction of the Member State. For example, two counterparties have a gas contract for the delivery at interconnection points with unbundled capacity (also called at the border). If the gas flows from the non-EU country to the EU Member State, the contract is reportable under REMIT as the counterparty (in the contract) receiving the gas is registered in the Member State.

On the contrary if the gas flows from the EU to the non-EU country, the contract is **not** reportable under REMIT as the counterparty receiving the gas is based in a non-EU country.

b. The entry point (e.g. terminal) is the physical delivery point where the commodity changes hands at an entry point. For example, this can be a terminal (e.g. Eemshaven) in the Netherlands where a seller delivers the gas to the buyer before the gas flows into the TTF hub (balancing zone).

4. **Natural gas storage or LNG facility.** This is the gas facility the contract refers to (physical location). The delivery point should be reported in line with what is specified in the contract. If the contract refers to a specific sub-terminal, then both parties should report the corresponding EIC code for that sub-terminal. If the contract instead refers to the main terminal, the EIC W code for the aggregate terminal may be used.

2.4. Lifecycle events

The REMIT transaction reporting requirements related to lifecycle events of transactions reportable in Table 1 and Table 2 are specified in Annex I to the TRUM. In addition, a non-exhaustive list of examples for reporting lifecycle events can be found in Annex II to the TRUM.

The lifecycle events of transactions are to be reported via Data Fields (88) and (51) in Table 1 and Table 2, respectively, on Action type.

The applicable action types are the following:

a) Action type N for ‘new’ identifies the submission of a transaction record for the first time;

b) Action type M for ‘modify’ identifies the modification of details of a previously reported record due to the business event;

c) Action type C for ‘cancel’ identifies the early termination of a previously reported record or cancellation (i.e. permanent withdrawal or suspension) of an order due to the business event;

d) Action type E for ‘error’ identifies the invalidation of a wrongly submitted record.

Market participants should note that the reporting of lifecycle events under REMIT may differ from lifecycle events reported under other EU legislation. In fact, the following are not expected to be reported under REMIT as lifecycle events since they are not activities related to the execution or modification of a transaction entered into a wholesale energy market: confirmation, compression, settlement (pre-

settlement, excluding early termination and/or post-settlement activities), notional increase/decrease (relative to commodity index transactions including derivatives), clearing or option exercise.

3. Supply contracts to be reported on a periodic basis

Article 4(2) of the REMIT Implementing Regulation specifies that transactions relating to the supply or storage of electricity or the supply of natural gas to a single consumption unit with a technical capability to consume 600 GWh/year or more, unless concluded on an OMP, shall be reported on a periodic basis. Further information on the reporting obligations, including the timing of reporting of transactions with such energy intensive final consumers, is available in the Guideline on REMIT Transaction Reporting.

In ACER's understanding such transactions with energy intensive final consumers falling above the prespecified threshold are typically concluded bilaterally and entail features of non-standardisation. Therefore, they are expected to be reported as non-standard contracts in Table 2 together with the related executions reported in Table 1. This implies that the reporting requirements specified in the TRUM and its annexes for non-standard supply contracts reportable under Article 3(a) of the REMIT Implementing Regulation shall also be considered applicable to supply contracts reportable under Article 4(2) of the REMIT Implementing Regulation.

For cases when multiple deliveries were executed **to the same delivery point or zone** and under the **very same non-standard contract**, only one execution report shall be reported to ACER in Table 1 by using the *priceIntervalQuantityDetails* section of the Trade List in the schema. This means that in the case of monthly invoicing, the execution information of six (monthly) deliveries needs to be sent in one single report by indicating:

- a single UTI in Data Field (38) Unique transaction ID;
- the contract ID of the respective non-standard contract (previously reported in Table 2) in Data Field (39) Linked transaction ID;
- the delivery point or zone in Data Field (78) where all the deliveries were executed; and
- the price and quantity information in the *priceIntervalQuantityDetails* section using Data Fields (84), (85), (86) and (87), i.e. each delivery interval (six in total) shall reflect the respective final price and quantity of the energy delivered per execution.

In addition, it is important to note that if the transaction with a final consumer is considered a bilateral trade with a fixed price and quantity it may be reported by using Table 1. If the bilateral trade has a fixed quantity but the price is defined by a complex formula in Data Field (46), then once the final price is known, a lifecycle event shall be sent with Action type M to report the final price in Data Field (45). For more information, see Data Fields (27) and (46) related to fixing index and price formula.

Market participants are expected to consult Annex II to the TRUM on examples for reporting non-standard contracts and their executions using Table 2 and Table 1 respectively featuring a non-standard contract with an energy intensive final customer.

In addition, the lifecycle reporting requirements applicable to non-standard contracts described in Annex I to the TRUM shall be considered applicable also for transactions with energy intensive final consumers.

4. Transportation contracts to be reported on a continuous basis

According to Article 3(b) of the REMIT Implementing Regulation, the following contracts concerning wholesale energy products in relation to the transportation of electricity or natural gas in the EU shall be reported:

(i) transactions relating to the transportation of natural gas between entry–exit systems in the EU and between entry–exit systems in the EU and transmission systems outside of the EU, or transactions relating to the transportation of electricity as a result of a primary capacity allocation by or on behalf of the transmission system operator, including physical or financial capacity rights;

(ii) transactions relating to the transportation of natural gas between entry–exit systems in the EU and between entry–exit systems in the EU and transmission systems outside of the EU, or transactions relating to the transportation of electricity between market participants on secondary markets, specifying physical or financial capacity rights, options or obligations, including resale and transfer of such capacity;

(iii) transactions related to options, futures, forwards, swaps and any other derivatives relating to the transportation of electricity or natural gas, including contracts-for-difference, irrespective of where and how they are traded.

As set out in Article 7(1)(c) and (d), transactions referring to standard and non-standard contracts for the transportation of electricity shall be reported using Table 3, while transactions referring to standard and non-standard contracts for the transportation of natural gas shall be reported in Table 4 of the Annex to the REMIT Implementing Regulation.

4.1. Transportation contracts for electricity

4.1.1. Continuous explicit intraday cross-border capacity allocation

In case when the relevant allocation rules define that the allocated intraday cross-border capacity is automatically nominated with no possibility of intervention from the market participant and that the amounts of allocated and nominated intraday cross-border capacity are equal, then there is no need for the relevant TSOs or third party acting on their behalf to submit separate reports for both the allocated and nominated capacity information. Only the nominated cross-border capacity shall be reported to ACER.

In case the relevant allocation rules allow the market participant to nominate a different amount of cross-border capacity to the allocated amount, then both the allocated and the nominated capacity will have to be reported to ACER.

4.2. Transportation contracts for natural gas

4.2.1. Capacity conversion from unbundled to bundled capacity

In the case of capacity conversion from unbundled to bundled capacity, the initial capacity contract needs to be modified after the conversion by indicating the following information in the modified report.

Scenario 1. The capacity conversion applies to the entire period of the initial capacity contract:

- Data Field (5) Transportation transaction identification shall be populated with the same transaction ID as the initial capacity contract;
- Data Field (18) Action type shall be populated with ‘66G’ for ‘Changed’;

- Data Field (19) Quantity shall indicate '0' (zero) quantity to flag that all the capacity has been converted into bundled capacity;
- Data Field (27) Bundling shall indicate 'ZEP' for 'Unbundled capacity'.

Scenario 2. The capacity conversion applies only to a certain part(s) of the total period included in the initial capacity contract. In this case, both periods – where the capacity conversion applies and where it does not – shall be reported in the same file (i.e. in the modified report) and shall be indicated in the following way.

TRUM field	Schema field	Section in the schema	To report
Data field (18) Action type	<process_Transaction.action_Status.statusCode>	<GasCapacityAllocation_Document>	'66G' for 'Changed'
Data Field (27) Bundling	<process_Transaction.capacityType.code>		'ZEP' for 'Unbundled capacity'
Data Field (5) Transportation transaction identification	<identification>	Transportation_Transaction	The same transaction ID as the initial capacity contract
For sub-period A: the period(s) where the capacity conversion is applicable			
Data Field (13) Start date and time Data Field (14) End date and time	<timeInterval>	Transportation_Period	The period referring to the converted capacity
Data field (19) Quantity	<contract_Quantity.quantityAmount>		The field shall indicate '0' (zero) quantity
For sub-period B: the period(s) where the capacity conversion is not applicable			
Data Field (13) Start date and time Data Field (14) End date and time	<timeInterval>	Transportation_Period	The period to which the capacity conversion does not apply
Data field (19) Quantity	<contract_Quantity.quantityAmount>		The field shall indicate the quantity included in the initial capacity contract

In both scenarios, since capacity conversion constitutes a change in the main contractual aspects (product quality), TSOs will also have to report the transformation of the initial capacity contract as a **new** contract, by indicating the following information in the new report:

- Data Field (5) Transportation transaction identification shall be populated with a new transaction ID compared to that of the initial capacity contract;
- Data Field (13) Start date and time and Data Field (14) End date and time shall indicate only the period(s) for which the capacity conversion is applied;
- Data Field (18) Action type shall be populated with '62G' for 'Active';
- Data Field (27) Bundling shall indicate 'ZEO' for 'Bundled capacity'.

In the case of bundled capacity, each reporting party reports its contractual part of the transaction.

4.2.2. Capacity upgrade from interruptible to firm capacity

The same approach as described above for capacity conversion is expected to be applied when the capacity underlying the initial capacity contract has been upgraded from interruptible to firm capacity. In this case, Data Field (16) Capacity category shall be populated with 'Z05' for 'interruptible (booked)' in the modified report of the initial capacity contract. For the new contract which results from the capacity upgrade, Data Field (16) shall be populated with the code of the relevant capacity type/category, for example, ZEQ, Z06, ZES, ZET, etc.

4.2.3. Tariff changes

In the case of floating tariffs, the regulated price, i.e. capacity charges, are not fixed. In the case of long-term contracts, it is understood that there is no need to send tariff changes as a modification of the contract if the usage of the tariff is well-defined in a contract and if the tariff change is made publicly available by the TSO or by the respective NRA.

5. LNG market and trade data

In relation to contracts for supply, as set out to Article 7c of REMIT, LNG market participants shall submit daily to ACER the LNG market data, free of charge, by means of the reporting channels established by ACER, in a standardised format, through a high-quality transmission protocol, and as close to real-time as technologically possible before the publication of the daily LNG price assessment (18:00 CET).

In addition, contracts for the supply of LNG with delivery in the EU are considered reportable under REMIT as set out in Article 3(a) of the REMIT Implementing Regulation.

In order to allow the streamlined reporting of transactions that fall under the scope of both reporting obligations mentioned above (referred to as 'LNG market and trade data'), such transactions shall be reported by using the dedicated electronic format, i.e. Table1LNG.

The dedicated guidance on how to report LNG market and trade data under REMIT is available in Annex III to the TRUM.

6. Data fields related to supply contracts to be reported in Table 1

Technical and business requirements when submitting the transaction record

This chapter provides in detail the reporting requirements on the information the data fields listed in Table 1 of the Annex to the REMIT Implementing Regulation shall be populated with.

It is worth noting that not all the data fields are considered mandatory for all transactions from a business perspective. The data fields are expected to be populated when applicable according to the cardinality table and guidance provided for the individual data fields in this manual. In addition, Annex I and Annex II to the TRUM shall be consulted in parallel with this manual. For the reporting of a transaction in an xml format in Table 1, the REMITTable1 electronic format shall be used.

Cardinality table of the data fields included in Table 1

M = mandatory
M* = conditionally mandatory
— = not applicable
DV = default value

Field no.	Field name	Traded on OMP		Traded bilaterally	
		Orders	Trades	Bilateral trades	Executions
Parties to the contract					
1	ID of the market participant or counterparty	M	M	M	M
2	Type of code used in field 1	M	M	M	M
3	Liquidity provision activity	M	—	—	—
4	ID of the trader and/or of the market participant or counterpart	M	M	M	—
5	Algorithm ID	M*	M*	—	—

6.1. Data fields related to parties to the contract

Data Field (1) ID of the market participant

No	Field identifier	Description
1	ID of the market participant	The field identifies by a unique code the market participant placing or concluding the transaction, or the organised marketplace (OMP) in case of system-generated orders.
Representation in electronic format		
	<idOfMarketParticipant>	OrderList/TradeList

Description of accepted values	Type	Length	Examples
ACER code LEI BIC EIC GLN / GS1 code	Alphanumerical	12 20 11 16 13	A0643278W.EU 1a2b3c4d5e6f7g8e9f0h ACERSILJ500 21X000EUROPEU–8 a1b2c3d4e5f6g

Field description

This field shall identify the market participant placing or concluding the transaction by its unique identification code on whose behalf the transaction is reported.

In addition, for the purpose of the REMIT reporting and in the context of concluded trades, the **other** market participant that is the actual counterparty to the market participant identified in Data Field (1) is referred to as the **other market participant** being identified in Data Field (6).

The market participant that places the order or concludes the trade has to be identified in the transaction report as the responsible entity for the trading activity. This does not necessarily imply that this market participant is the actual counterparty or the final beneficiary to the transaction, but it is responsible for the reporting. For example, in case of a DEA arrangement, the DEA provider shall be identified in this field (for further guidance, see Section 132.1.2.1).

The ID of the market participant identified in Data Field (1) is considered part of the unique key of the transaction record, it shall therefore remain unique throughout the lifecycle of the transaction. For more information, see Annex I to the TRUM.

The field is mandatory for all transactions reported in Table 1.

ACER code of the market participant

The market participant shall be identified in Data Field (1) by one of the unique codes registered with its NRA and available in CEREMP. If the market participant possesses different types of unique identification codes listed as accepted values under this field, all these need to be provided to the NRA, and thus be made available in CEREMP, upon the registration of the market participant.

When the market participant registers with the relevant NRA, the market participant will receive an ACER code. From ACER's perspective, it is preferable to use the ACER code from the reporting point of view. Nevertheless, for example, if a market participant is already using the LEI code for European Market Infrastructure Regulation ([13]) (EMIR) reporting, that market participant may also use the LEI

([13]) Regulation (EU) No 648/2012 of the European Parliament and of the Council of 4 July 2012 on OTC derivatives, central counterparties and trade repositories (OJ L 201, 27.7.2012, p. 1, ELI: http://data.europa.eu/eli/reg/2012/648/oj).

code for REMIT reporting, as long as the LEI code has been provided to the relevant NRA in the registration process.

If a market participant is using its ACER code, this can be used by its counterparty to verify the identity of the market participant through CEREMP available on the REMIT Portal.

It may occur that the ACER code is not known to the OMP or to the other reporting party reporting on behalf of the market participant. If the ACER code has not been provided by the market participant to the OMP (for OMP transactions) or to the other reporting party reporting on behalf of the market participant (for bilateral trades), one of the alternative codes listed above and registered in CEREMP shall be used; otherwise, the report will be rejected as invalid.

Data Field (2) Type of code used in field 1

No	Field identifier	Description
2	Type of code used in field 1	The field indicates the type of the unique code used in field 1.

Description of accepted values	Type	Length	Examples
ACER code LEI BIC EIC GLN/GS1 code	Text	3 3 3 3 3	ace lei bic eic gln

Field description

This field identifies the type of code used in Data Field (1). For example, if a LEI code is used in the report to identify the market participant in Data Field (1), the accepted value in this field shall be ‘lei’. If an ACER code is used in Data Field (1), the accepted value reported in this field is ‘ace’.

If a market participant which is a financial entity chooses to use a BIC code for Data Field (1), it could be the case that the code is less than 11 characters long. In such a case, typically when an 8-digit code is given, the code has to be reported by adding ‘XXX’ at the end, to ensure the 11-digit length.

The field is mandatory for all transactions reported in Table 1.

Data Field (3) Liquidity provision activity

No	Field identifier	Description
3	Liquidity provision activity	The field identifies whether the order was submitted to the trading venue as part of a market making strategy.
Representation in electronic format		
	<liquidityProviderIndicator>	OrderList

Description of accepted values	Type	Length	Examples
true false	Text	5	true

Field description

The field shall identify whether the market participant reported in Data Field (1) has placed the reportable order on the OMP as part of a contractual arrangement with the OMP for providing a service for market making. In such case, in the order report this field shall be populated with 'true'.

The liquidity provider (market maker) is considered a member of the OMP. Nevertheless, ACER acknowledges that under the financial regulation in some specific cases such a function could also be carried out by the client of the member (e.g. DEA client) using the member's account for the trading activity.

If by placing the order the market participant provides liquidity under its normal business operation (not under a formal liquidity provision agreement with the OMP), the value 'false' shall be reported.

The flag under this field is expected to be populated by the OMP when reporting its order book given that the flag is intended to identify such orders that have been placed as per the market marking service agreement in place with the OMP.

In case the OMP already has arrangements in place in its trading system to flag activities related to liquidity provision activities as per its obligation under the Markets in Financial Instruments Directive (MiFID) ([14]), the OMP may apply the same reporting logic and process for transactions related to liquidity provision activities as established under its MiFID reporting.

The field is mandatory only for orders to trades.

Data Field (4) ID of the trader

No	Field identifier	Description
4	ID of the trader	The field identifies the login username or trading account of the trader used for the placing or conclusion of the transaction, as specified by the technical system of the OMP or identified by the market participant.
Representation in electronic format		
	<traderID>	OrderList/TradeList

Description of accepted values	Type	Length	Examples
Up to 100 alphanumerical digits	Alphanumeric	100	1234567890abcdefghi

Field description and cardinality

This field indicates the ID used by the OMP or by the market participant to identify the user responsible for entering into a transaction that is to be reported. In ACER's understanding this is typically an electronic ID for the trader's account or a technical representation of that account.

As the same trader may have multiple IDs, it is crucial that the relevant ID used by the trader for that particular transaction that is to be reported is always provided in this field.

This field is considered mandatory in the sense that there must be an identifier of the person or group of people responsible for taking decisions or actions in executing or amending the transaction. A number

([14]) Directive 2004/39/EC of the European Parliament and of the Council of 21 April 2004 on markets in financial instruments amending Council Directives 85/611/EEC and 93/6/EEC and Directive 2000/12/EC of the European Parliament and of the Council and repealing Council Directive 93/22/EEC (OJ L 145, 30.4.2004, p. 1, ELI: http://data.europa.eu/eli/dir/2004/39/oj).

or code does not disclose the identity of the person in the transaction reporting; thus, market participants and OMPs may report a number (or code) to avoid the reporting of names.

It is ACER's understanding that even if an algorithm is being used for the placing or the conclusion of the transaction, there is a 'human' trader responsible for the application of the algorithm for that particular transaction. Therefore, this field is considered mandatory irrespective of whether the placing or conclusion of the transaction involved algorithmic trading or not.

The field is mandatory for all orders and trades placed/concluded on an OMP or bilaterally, except for executions.

OMP transactions

In the case of transactions placed or concluded on an OMP, this field shall represent how the OMP identifies the trader. The uniqueness of the trader ID shall be maintained even if the trader is responsible for multiple algorithms.

With regard to orders to trade placed by executing brokers at the OMP, the trader ID of the executing broker as assigned by the OMP shall be reported in this field, if available to the OMP.

Bilateral trades

In the case of bilateral trades, this field is expected to represent the person or group of people concluding the trade. This implies that the trader ID is to be populated from the perspective of the market participant. If the trader ID becomes available to the designated reporting entity at a later stage (i.e. after the REMIT reporting of the trade), it is expected to be provided as a modification (update) to the original trade with Action type M.

Example: reporting of the trader ID for OMP and bilateral trades

- The OMP identifies Joe Bloggs with ID = 123Abc.
- The OMP identifies company (A) with ID = CompA123.
- Company (A) identifies Joe Bloggs internally with ID = Abc12345.

Scenario 1 – OMP transactions

- A trader called Joe Bloggs working at company (A) trades on an OMP.
- When the OMP reports the transactions placed/executed by Joe Blogges, the trader ID '123Abc' shall be reported in field 3 as identified by the OMP.

Scenario 2 – bilateral trades

- A trader called Joe Bloggs working at company (A) trades bilaterally.
- The trader ID as identified by company (A) shall be reported in field 3: 'Abc12345'.

Data Field (5) Algorithm ID

No	Field identifier	Description
5	Algorithm ID	The field indicates the identification code of the algorithm used for the placing or conclusion of the transaction.
Representation in electronic format		
	<algoId>	OrderList/TradeList

Description of accepted values	Type	Length	Examples
Up to 100 alphanumerical digits	Alphanumeric	100	1234567890abcdefghi

Field description

The field shall identify the ID of the algorithm placing the order and/or executing the trade on the OMP.

The field is mandatory in case the trading activity related to the transaction to be reported involved algorithmic trading as defined in Article 2(18) of REMIT and further clarified in the ACER Guidance on REMIT ([15]). If the transaction involved only human intervention, the field is not applicable.

It is important to note that Data Field (4) ID of the trader is also considered mandatory in the case of algorithmic trading as it is understood that there is always a human trader/user responsible for the conclusion of the transaction.

The field is not considered applicable in the case of transactions placed or concluded on auction markets.

Algorithms in scope

In ACER's view the guidance on reporting transactions under REMIT that involve algorithmic trading shall be in line with the definition and scope of algorithmic trading as clarified in the ACER Guidance on REMIT in relation to the notification obligation of market participants engaging in algorithmic trading ([16]). Therefore, market participants and OMPs are expected to consult the related section of the ACER Guidance on REMIT to comply with the transaction reporting requirements.

Identification of the algorithm

The identification code of the algorithm is expected to uniquely identify the algorithm used for the reported transaction within the firm, i.e. the market participant in the case of internal (i.e. the market participant's) or stand-alone vendor algorithms, or the OMP in the case of external (i.e. OMP's) execution algorithms. This implies that the same ID shall not be shared by multiple algorithms within the same firm.

Market participants shall ensure that the algorithms used for their trading activities related to transactions reported under REMIT are available to the relevant OMP. This requirement is particularly relevant in case the market participant is using internal or third-party vendor algorithms (i.e. not the OMP's execution algorithms). It is understood that when market participants are using in-house or third-party vendor algorithms when trading on an OMP, the algorithm IDs may be required to be registered at the relevant OMP before the algorithm is used for trading on that OMP. In the absence of such registration requirements, the market participants are expected to share the IDs of the applied algorithms with the relevant OMP prior to the REMIT reporting of the transaction.

([15]) Chapter 7.2 in ACER Guidance on REMIT (6.1st edition).
([16]) See Chapter 7 of the ACER Guidance on REMIT on the application of the obligation on the notification of algorithmic trading and direct electronic access.

The abovementioned requirement is meant to ensure that the algorithm ID can be provided in the first lifecycle event of the order/trade record reported with Action type N and maintained consistently throughout the lifecycle of the order.

It is essential to note that the identification code of the applied algorithm reported in this data field shall reflect exactly the same algorithm ID as originally assigned by the market participant (in the case of internal or stand-alone vendor algorithms), or by the OMP (in the case of external execution algorithms).

The lifecycle reporting requirements related to the information on the algorithm ID is specified in Annex I to the TRUM.

Data Field (6) ID of the other market participant (counterparty)

No	Field identifier	Description
6	ID of the other market participant (counterparty)	The field identifies by a unique code the other market participant being the counterparty to the transaction.
Representation in electronic format		
	<otherMarketParticipant>	TradeList

Description of accepted values	Type	Length	Examples
ACER code LEI BIC EIC GLN/GS1 code	Alphanumeric	12 20 11 16 13	A0643278W.EU 1a2b3c4d5e6f7g8e9f0h ACERSILJ500 21X000EUROPEU–8 a1b2c3d4e5f6

Field description

This field indicates the ID of the other market participant (counterparty) to the trade that is reported.

For bilateral trades and executions, the field is always considered mandatory.

The field is not considered applicable to orders to trade.

OMP transactions

If the trade takes place on an exchange and the other market participant is a central counterparty (CCP), clearing house or a clearing member, this field is not applicable.

Exchange-traded contracts are typically traded anonymously, so that neither party to the trade knows the identity of the counterparty. If the trade takes place on an exchange with orders to trade placed on the broker OMP, this trade should be reported as any other trade that takes place on exchange, i.e. Data Field (6) is not applicable.

Trade with a market participant without an ACER code

When a REMIT market participant enters into a bilateral trade (e.g. a financial swap related to gas delivered in the EU) with a non-REMIT market participant (e.g. a firm that only trades bilateral financial products related to EU gas or electricity and fulfils its reporting obligation under EMIR and never enters into a physical trade), or with a REMIT market participant without an ACER code (e.g. market participant is under registration), it may need to populate Data Field (6) with the fictitious ACER code ‘ACERNONMP.EU’ to indicate that the counterparty to the trade does not have an ACER code.

There may be a case where market participant A reports a trade with market participant B which is identified by ‘ACERNONMP.EU’ in the trade report reported by market participant A. Later market participant B registers with its relevant NRA and receives an ACER code. In such a scenario, this would be the case of novation as specified in Annex I to the TRUM.

Data Field (7) Type of code used in field 6

No	Field identifier	Description
7	Type of code used in field 6	The field indicates the type of the unique code used in field 6.

Description of accepted values	Type	Length	Examples
ACER code	Text	3	ace
LEI		3	lei
BIC		3	bic
EIC		3	eic
GLN/GS1 code		3	gln

Field description

This field identifies the type of code used in Data Field (6).

Data Field (8) Reporting entity ID

No	Field identifier	Description
8	Reporting entity ID	The field identifies the RRM by its ACER registration code as the reporting entity of the transaction.
Representation in electronic format		
	<reportingEntityID>	OrderList/TradeList

Description of accepted values	Type	Length	Examples
ACER code	Alphanumeric	12	A0643278W.EU

Field description

This field identifies, by its ACER code, the RRM that submits the transaction report to ACER on behalf of the market participant identified in Data Field (1).

The field is mandatory for all transactions reported in Table 1.

Data Field (9) ID of the market participants acting on a third-party account

No	Field identifier	Description
9	ID of the market participants acting on a third-party account	The field identifies the market participants acting directly or through a sub-delegation on the account of a third-party (on its own behalf or on behalf of another party), e.g. persons involved in direct electronic access arrangements.

Representation in electronic format		
	<clientIdentification>	*client* section in the OrderList/TradeList
	<clientSequence>	
	<deaSubdelegation>	

Description of accepted values	Type	Length	Examples
ACER code LEI BIC EIC GLN/GS1 code	Alphanumeric	12 20 11 16 13	A0643278W.EU 1a2b3c4d5e6f7g8e9f0h ACERSILJ500 21X000EUROPEU–8 a1b2c3d4e5f6

Field description

The field identifies the market participant placing or concluding a transaction on the account of a third-party, i.e. the account of the market participant identified in Data Field (1).

The field is mandatory for transactions taking place on the on the organised marketplace where the account of the market participant identified in Data Field (1) is delegated to another market participant that places or concludes the transactions on the organised marketplace.

Direct electronic access

As described in Chapter 2.1.2.1 when a DEA provider offers the DEA service to its DEA client (client 1) on an OMP, the transactions are concluded by the DEA client via the account of the DEA provider.

This implies that the DEA client shall be identified in this field by one of its unique codes registered in CEREMP, while the DEA provider is to be identified in Data Field (1) (being the registered member of the OMP) via one of its unique codes registered in CEREMP.

If the DEA client cannot be identified in the original record with Action type N, the record shall be updated with the ID of the DEA client by using Action type M once available.

It is also understood that the DEA client may sub-delegate the trading account of the DEA provider to a sub-delegated client (client 2), if such sub-delegation is allowed by the DEA provider. Such sub-delegation may happen multiple times across the DEA chain in a cascading manner.

In the electronic format Data Field (9) is being represented via three schema fields in the ***client* section** (being repeatable) in the OrderList and TradeList:

- <clientIdentification>
- <clientSequence>
- <deaSubdelegation>

Fields <clientIdentification> and <clientSequence> shall always be populated in case of a DEA to identify the DEA client (client 1). In this case the client sequence number shall always be populated with value ‘1’ together with the unique code of the client as described above.

In addition, in case of sub-delegation, the sub-delegated client (e.g. client 2) that is effectively using the account of the DEA provider to place or conclude the reportable transaction is also expected to be reported in field <clientIdentification>, with sequence number populated with value ‘2’.

Furthermore, the mandatory field <deaSubdelegation> shall always be reported in order to flag whether for that particular transaction, the DEA client identified with sequence number 1 (client 1) has sub-delegated the account to another client (e.g. identified with sequence number 2), or if client 1 was using the account. In case of sub-delegation, value ‘true’ is to be reported **irrespective** of the availability of the identification code of the sub-delegated client. Otherwise, value ‘false’ shall be populated.

For the reporting of the final beneficiary in case of DEA, see Chapter 2.1.2.1 and Data Field (10).

Example 1: DEA client acts on its own behalf (no sub-delegation)

Field name	Population of the field
Data Field (1) ID of the market participant or counterparty	ID of the DEA provider
Data Field (9) ID of the market participants acting on a third-party account	
<clientIdentification>	ID of the DEA client
<clientSequence>	1
<deaSubdelegation>	false
Data Field (10) Beneficiary ID	Blank

Example 2: DEA client acts on behalf of a final beneficiary (no sub-delegation)

Field name	Population of the field
Data Field (1) ID of the market participant or counterparty	ID of the DEA provider
Data Field (9) ID of the market participants acting on a third-party account	
<clientIdentification>	ID of the DEA client
<clientSequence>	1
<deaSubdelegation>	false
Data Field (10) Beneficiary ID	ID of the final beneficiary

Example 3: Sub-delegated client (client 2) acts on its own behalf and it is identified in Data Field (9)

Field name	Population of the field
Data Field (1) ID of the market participant or counterparty	ID of the DEA provider
Data Field (9) ID of the market participants acting on a third-party account	
<clientIdentification>	ID of the DEA client
<clientSequence>	1
<deaSubdelegation>	true
<clientIdentification>	ID of the Sub-delegated client
<clientSequence>	2
<deaSubdelegation>	false
Data Field (10) Beneficiary ID	Blank

Example 4: Sub-delegated client (client 2) acts on its own behalf but is **not** identified in Data Field (9)

Field name	Population of the field
Data Field (1) ID of the market participant or counterparty	ID of the DEA provider
Data Field (9) ID of the market participants acting on a third-party account	
<clientIdentification>	ID of the DEA client 1
<clientSequence>	1
<deaSubdelegation>	true
Data Field (10) Beneficiary ID	ID of the sub-delegated client being the final beneficiary

Example 5: Sub-delegated client (client 2) acts on behalf of a final beneficiary and client 2 is **not** identified in Data Field (9)

Field name	Population of the field
Data Field (1) ID of the market participant or counterparty	ID of the DEA provider
Data Field (9) ID of the market participants acting on a third-party account	
<clientIdentification>	ID of the DEA client
<clientSequence>	1
<deaSubdelegation>	true
Data Field (10) Beneficiary ID	ID of the final beneficiary

Data Field (10) Beneficiary ID

No	Field identifier	Description
10	Beneficiary ID	The field identifies by a unique code the beneficiary of the transaction when the beneficiary is not the same as the market participant identified in field 1 or in field 9.
Representation in electronic format		
	<beneficiaryIdentification>	OrderList/TradeList

Description of accepted values	Type	Length	Examples
ACER code LEI BIC EIC GLN/GS1 code	Alphanumeric	12 20 11 16 13	A0643278W.EU 1a2b3c4d5e6f7g8e9f0h ACERSILJ500 21X000EUROPEU–8 a1b2c3d4e5f6g

Field description

This field indicates the ID of the final beneficiary of the transaction by one of its unique codes listed as allowed values under this data field.

Pursuant to Article 8(1) of REMIT, the final beneficiary is reportable information within the transaction record related to a wholesale energy product, therefore Data Field (10) has to be considered in case the trading activity is carried out by a market participant identified in Data Field (1) or Data Field (9) on behalf of another entity being the **final beneficiary** to the transaction.

If the market participant reported in Data Field (1) or Data Field (9) is the final the beneficiary to the transaction, then Data Field (10) is not applicable.

If the market participant reported in Data Field (1) or Data Field (9) is **not** the final beneficiary to the transaction, the reporting market participant shall identify the beneficiary in this field.

For example, if party A is trading on behalf of party B, then party B is the beneficiary and party A is acting on behalf of party B as an agent, as defined in Data Field (12). As party A enters into transactions on a wholesale energy market, party A is considered a market participant and must be reported in Data Field (1), while party B shall be identified as the final beneficiary in Data Field (10).

If a market participant (market participant A) is trading on behalf of a final beneficiary (party B), the other market participant (market participant C) being the counterparty to the trade is not required to identify party B in its respective transaction report (i.e. the record representing the trade leg of market participant C). Market participant C, however, shall populate this field if it also acts as an agent on behalf of a final beneficiary.

OMP transactions

In the case of OMP transactions, the ID of the final beneficiary may not be known to the OMP for agency transactions, therefore the beneficiary ID is expected to be provided by the relevant market participant to the OMP.

If the information on the beneficiary of the transaction is not available to the OMP, this field may be left blank. For example, the OMP may only know the market participant (or the executing broker in case of exchange) that executed the transaction. Also, when the trade is submitted for clearing, this information may be lost because the clearing house only executes transactions against its clearing members, and the market participant may (in the case of self-clearing members) or may not be the ultimate beneficiary. In such cases it is expected that the OMP where the trading activity occurs is informed by the relevant market participants whenever they trade on behalf of a third party. Nevertheless, even in such cases Data Field (12) Trading capacity of the market participant or counterparty shall be populated with ‘A’ for ‘agent’ and once the beneficiary ID is available it shall be reported as a lifecycle event with Action type M.

With regard to orders placed and trades concluded by **executing brokers** at the OMP, the beneficiary ID of the executing broker’s client shall also be reported in this field. The executing broker’s clients should make the IDs required for the reporting available to the OMP.

Direct electronic access

In case of DEA, this field may be left blank when the DEA Client (client 1), or in case of sub-delegation the sub-delegated client (client 2) is identified in Data Field (9) and trades on its own behalf.

If the DEA Client (client 1) or sub-delegated client (client 2) identified in Data Field (9) trades on behalf of a final beneficiary, the final beneficiary shall be identified in this field, latest as a lifecycle reporting with Action type M.

Bilateral trades

Bilateral trades concluded outside the OMP may constitute the following arrangement: market participant A sells to market participant B with beneficiary C. In these cases, one trade report for the buy and one trade report for the sell side shall be reported: A sells to B with C identified in Data Field (10) as beneficiary.

However, the series of trades may be even more complex, and it may involve more parties. For example, if a bilateral trade takes place off-market between market participant A and market participant B, there may be other trades between B and other parties (e.g. C and D) to represent how they split the value of the A and B trade.

Data Field (11) Type of code used in field 9 and in field 10

No	Field identifier	Description
11	Type of code used in field 9 and in field 10	The field indicates the type of the unique codes used in fields 9 and 10.

Description of accepted values	Type	Length	Examples
ACER code LEI BIC EIC GLN/GS1 code	Text	3 3 3 3 3	ACE LEI BIC EIC GLN

Field description

This field identifies the type of code used in Data Fields (9) and (10).

Data Field (12) Trading capacity of the market participant or counterparty in field 1

No	Field identifier	Description
12	Trading capacity of the market participant or counterparty in field 1	The field indicates whether the market participant or counterparty in field 1 has placed or concluded the transaction as principal or as agent.
Representation in electronic format		
	<tradingCapacity>	OrderList/TradeList

Description of accepted values	Type	Length	Examples
P = Principal A = Agent	Text	1	P

Field description

This field identifies the trading capacity of the market participant in Data Field (1).

If the market participant is acting on its own behalf, this field shall be populated with ‘P’ for Principal.

If the market participant is acting on behalf of a third party as an agent and the beneficiary identification is known by the OMP and reported in Data Field (10), this field shall be populated with ‘A’ for ‘Agent’.

Nevertheless, if the market participant is acting on behalf of a third party as an agent and the OMP is aware that a transaction is concluded on behalf of a third party, this field shall be populated with value ‘A’, irrespective of whether the identification of the final beneficiary is known at the time of the REMIT reporting.

The field is mandatory for all transactions reported in Table 1.

Direct electronic access

When reporting transactions placed or concluded on an OMP under a DEA arrangement where the DEA client (client 1) or the sub-delegated client (client 2) uses the trading account of the DEA provider,

value ‘A’ shall be reported in this field to indicate that the market participant identified in Data Field (1) is not the final beneficiary to the transaction. It is, however, to be noted that in ACER's view the DEA provider when providing its account to the DEA client (hence the DEA provider is neither placing nor concluding these transactions but provides its trading account), it is not considered to be an agent trading on behalf of the DEA client (or on behalf of the sub-delegated client, in the case of sub-delegation).

Data Field (13) Buy / sell indicator

No	Field identifier	Description
13	Buy / sell indicator	The field indicates whether the transaction was a buy or sell (or in certain scenarios both).
Representation in electronic format		
	<buySellIndicator>	OrderList/TradeList

Description of accepted values	Type	Length	Examples
B = Buy S = Sell C = Buy and Sell	Text	1	B

Field description

The buy/sell indicator indicates whether the market participant is reporting a transaction for the buying or selling of a contract. Value ‘B’ shall be indicated for **buy** and value ‘S’ shall be indicated for **sell** from the perspective of the reporting market participant or, in the case of an agent (e.g. executing broker) transaction, from the perspective of the client.

The field is always mandatory for all transactions reported in Table 1.

OMP transactions

For orders placed on an OMP, this field should indicate whether the market participant identified in Data Field (1) (or in Data Field (9) if applicable) has the intention to buy or sell the contract.

However, in some auction markets, there may be circumstances where an order is a buy and sell. In such cases, this order is to be identified by a combined buy and sell indicator, i.e. value ‘C’.

For derivatives that have not been reported under EMIR, and are therefore reported under REMIT, the following buyer and seller logic should apply.

- In the case of a **fixed-to-floating** derivative, if party X buys a swap, then party X pays a fixed price, and party Y pays a floating price. This means that party X receives the floating leg and party Y receives the fixed leg. Party X will be identified as a buyer (B) and party Y will be identified as a seller (S).
- In the case of a **floating-to-floating** derivative, if party X buys a swap, party X pays the floating price of the first leg (or index) and party Y pays the floating price of the second leg (or second index). In this case, the legs (indices) should be sorted alphabetically. Party X will be identified as a buyer (B) and party Y will be identified as a seller (S).

Bilateral trades and executions

Since the REMIT Implementing Regulation requires two-sided reporting, each trade report should indicate the side of the trade for the reporting market participant as a buyer or a seller.

Data Field (14) Initiator / Aggressor / Sleeve

No	Field identifier	Description
14	Initiator / Aggressor / Sleeve	The field indicates whether the order to trade is an initiating or an aggressing order when the trade is executed on an electronic broker platform or a voice assisted broker platform.
Representation in electronic format		
	<aggressor>	TradeList

Description of accepted values	Type	Length	Examples
I = Initiator A = Aggressor S = Sleeve	Text	1	A

Field description

This field is considered applicable when the trade was executed at an electronic broker platform or a voice assisted broker platform.

Value 'A' shall be indicated if the market participant identified in Data Field (1) was the originator of the trade (aggressor) and value 'I' shall be indicated if the market participant was the 'passive' participant (initiator), i.e. the one placing the order in the market first.

A buyer is identified as an aggressor if the market participant submits an order which matches with a sell order (initiator) that is already visible to the market.

A seller is identified as an aggressor if the market participant submits an order which matches with a buy order (initiator) that is already visible to the market.

The field is mandatory for trades when executed on a broker-type OMP.

This field does not apply to orders to trade.

Trading in a sleeve

ACER's understanding of a 'sleeve trade' is the following: market participant A intends to enter into a transaction with market participant B which has placed an order on an OMP. However, because market participant A and market participant B do not have an agreement to trade (or limited credit status), the broker may find a third market participant (market participant C) who has an agreement to trade with both market participant A and market participant B and is willing to sleeve the trade (buy and sell the same contract simultaneously) for them.

There are two trades in this type of scenario: one trade between market participant A and market participant C (e.g. market participant A buys from market participant C) and another trade between market participant C and market participant B (e.g. market participant C buys from market participant B). As a result of such a sleeve arrangement, the resulting trade consists of four legs to be reported to ACER in the following way.

When market participant A buys from market participant C:

- market participant A reports the trade as buyer and as aggressor ('A'); and
- market participant C reports the trade as seller and as sleeve trade ('S').

When market participant C buys from market participant B:

- market participant C reports the trade as buyer and as sleeve trade ('S'); and
- market participant B reports the trade as seller and an initiator ('I').

Linking transactions when trading in sleeve

When market participants enter into a sleeve trade, the resulting legs of the trade shall be linked. By following the example of a sleeve trade provided above, the reporting under REMIT should be done in the following way.

When market participant A buys from market participant C:

- market participant A reports the trade as buyer and as aggressor ('A'); and
- market participant C reports the trade as seller and as sleeve trade ('S').

Market participant A and market participant C shall report UTI 123 in Data Field (38) Unique transaction ID.

When market participant C buys from market participant B:

- market participant C reports the trade as buyer and as sleeve trade ('S'); and
- market participant B reports the trade as seller and an initiator ('I').

Market participant B and market participant C shall report UTI 456 in Data Field (38) Unique transaction ID.

Market participant C in its **sell** sleeve report (reported with UTI 123) shall populate Data Field (39) Linked transaction ID with UTI 456 and follow the same logic in its **buy** sleeve trade report, i.e. populate Data Field (39) with UTI 123.

For further examples on reporting sleeve trade, see Annex II to the TRUM.

6.2. Data fields related to order details

Data Field (15) Order ID

No	Field identifier	Description
15	Order ID	The field identifies the order by using a unique code identifier throughout its lifecycle as provided by the organised marketplace or the trade-matching system.
Representation in electronic format		
	<orderId>	OrderList

Description of accepted values	Type	Length	Examples
Up to 100 alphanumerical digits	Alphanumeric	100	12345abcdef

Field description

This field identifies the unique ID of the reported order as specified by the OMP.

The ID of the order shall be unique for that contract and for that OMP the reported order refers to. The order ID shall be maintained throughout the lifecycle of the order, i.e. the same ID shall be used to identify the order throughout the remainder of its lifecycle as reported in its first lifecycle with Action type N.

The field is always mandatory for orders to trade.

Data Field (16) Order type

No	Field identifier	Description
16	Order type	The field indicates the type of order as defined by the functionality offered by the OMP or the trade-matching system.
Representation in electronic format		
	<orderType>	OrderList

Description of accepted values	Type	Length	Examples
BLO = Block	Text	3	MAR
CON = Convertible			
COM = Combination			
EXC = Exclusive			
FHR = Flexible Hour			
HYB = Hybrid			
IOI = Indication of Interest			
LIM = Limit			
LIN = Linked			
LIS = Linear Step			
MAR = Market			
MOP = Market order with protection			
MTL = Market to Limit			
SMA = Smart Order			
SOP = Stop order with protection			
SPR = Spread			
STP = Step			
VBL = Variable Block			
OTH = Other			

Field description

Every order shall be identified by at least one of the order types included in the list of accepted values of this field. In the case of an order where multiple order types might apply, as defined by the functionality offered by the OMP, reporting parties shall select the order type among the accepted values that best represents the key characteristic of the order.

The field is always mandatory for orders to trade.

Description of the accepted values

BLO = Block. An order which is linked to one or more orders for the purpose of trading (that must have the same price and the same quantity according to the trading venue's rules) irrespective of whether the periods (e.g. half hours, hours) are contiguous.

CON = Convertible. An order which under certain market conditions may be converted from a block order to a single hourly order.

COM = Combination. An order which refers to two or more orders concerning different series and where the respective orders are executed simultaneously.

EXC = Exclusive. A complex order type where the linked order is the exclusive order, i.e. only one of the orders can be transacted.

FHR = Flexible hour. A specific order that can trade at any hour provided that the price and volume are matched.

HYB = Hybrid. A linear order that refers to hybrid curves featuring the combination of linear step (LIS) and step (STP) curves.

IOI = Indication of interest. Quotations on trading venues advertised on the screens of the OMP.

LIM = Limit. An order submitted with a specified limit price which can be executed either in part or in full at its limit price (i.e. at the price set by the market participant) or better.

LIN = Linked. An order where there is a dependency on/from another order or multiple orders for choosing to trade either one or the other or both orders.

LIS = Linear step. An order where the specified step range is matched linearly.

MAR = Market. An unpriced order that will execute against the best priced orders.

MOP = Market order with protection. An unpriced order that will execute against the best priced orders within a defined protection range.

MTL = Market to limit. A market order that executes at the best price. In case the MTL order is partially matched, the remaining part is cancelled and then reinserted into the order book with order condition LIM and a price equal to the one at which the matched portion was executed.

SMA = Smart order. An order can be either against a financial or physical contract.

SOP = Stop order with protection. A stop order that becomes a limit order with protection price once triggered.

SPR = Spread. An order where the order contains more than one contract, for example, taking either long or short position in different contracts.

STP = Step. An order which defines a specific step range or step price.

VBL = Variable block. An order in which the block quantity and/or price can vary, for example, different quantity at different hours.

OTH = Other. ACER expects reporting parties to use the value ‘Other’ only in exceptional cases and to notify ACER via the REMIT query form in a timely manner in case none of the above-listed accepted values are applicable to the type of transaction/contract they intend to report.

Data Field (17) Order condition

No	Field identifier	Description
17	Order condition	The field indicates a special condition for the order to be executed.
Representation in electronic format		
	<orderCondition>	OrderList

Description of accepted values	Type	Length	Examples

AON = All or None FAF Fill and Float FAK = Fill and Kill FOK = Fill or Kill HVO = Hidden Volume MEV = Minimum Execution Volume OCO = One Cancels Other PRE = Preference PRI = Priority PTR = Price Trigger SLO = Stop Loss Order OTH = Other		3	FOK

Field description

This field identifies the condition for the order, identified in Data Field (15), in relation to its execution. The order condition refers to different behaviours of the order types in combination with the order definition and the specific lifecycle event of the order.

In case the order has no special condition, the field is not applicable.

Description of the accepted values

AON = All or none. An order which must be filled in full otherwise it will remain in the order book until the entire volume is matched.

FAF = Fill and float. An order which will be killed immediately after matching with any available volume in the order book. If not filled at all, the order stays in the order book.

FAK = Fill and kill. An order which must be filled as much as possible immediately upon entry; otherwise, it is removed from the order book.

FOK = Fill or kill. An order which must be filled immediately in full when it is entered into the order book; otherwise, it will be removed from the order book without trading.

HVO = Hidden volume. An order that has a hidden quantity, which is part of the total quantity of the order. The hidden volume information shall be reported in Data Field (21) Undisclosed volume.

MEV = Minimum execution volume. An order which specifies a minimum volume of the order that must be matched to allow trading. The applicable minimum volume information shall be reported in Data Field (19) Minimum execution volume.

OCO = One cancels other. An order which if triggered cancels another order.

PRE = Preference. An order which will trade with a specific participant or participants in preference of others.

PRI = Priority. An order which has a priority obligation for trading, i.e. it cannot trade with a participant within its own group.

PTR = Price trigger. An order which will not be available for execution unless a specific trigger price is reached, similar to a stop-loss order, but may be triggered across product pricing, i.e. the price trigger may be based on a different contract or index. The applicable price limit shall be reported in Data Field (20) Price limit.

SLO = Stop-loss order. An order that is submitted to the market as a limit order or market order once a certain price condition of an instrument is met (including profit taking). The price trigger refers to the same tradable instrument. SLO orders are reportable with order status ‘Active’ once it is activated and becomes visible in the order book. The applicable price limit shall be reported in Data field (20) Price limit.

OTH = Other. ACER expects reporting parties to use the value 'Other' only in exceptional cases and to notify ACER via the REMIT Query Form in a timely manner in case none of the above-listed accepted values would be applicable to the type of transaction/contract they intend to report.

Data Field (18) Order status

No	Field identifier	Description
18	Order status	The field indicates the status of the order in the order book, for example if the order is active or deactivated.
Representation in electronic format		
	<orderStatus>	OrderList

Description of accepted values	Type	Length	Examples
ACT = Active COV = Converted EXP = Expired MAC = Matched PMA = Partial Matched REF = Refilled SUS = Suspended WIT = Withdrawn	Text	3	ACT

Field description

This field indicates the status of the order identified in Data Field (15). Every order shall have a status based on the list of accepted values available in this field for each lifecycle of the order record. In addition, changes in the order status are considered as a lifecycle event as described in Annex I to the TRUM.

Always a single order status can be considered as applicable to the order record.

With regard to adopting order status in the case of transactions placed/concluded on auction markets, see Annex I to the TRUM.

The field is always mandatory for orders to trade.

Description of the accepted values

ACT = Active. The order has been activated by the system or the market participant and is visible to the market (the latter is not applicable in the case of auction markets). If an order is not activated in the order book, for example, 'Iceberg' created but inactive or stop-loss order (SLO) not activated, it is not reportable until activation.

COV = Converted. A block order or variable block order which has been converted into a single order. For example, if an order with order type 'BLO' (block) or 'VBL' (variable block) has been converted into a single order, such an event is considered as a lifecycle event with Action type 'M' for 'modify' to indicate the change in the order status as 'COV' (converted).

EXP = Expired. The order has expired as per its order duration or order conditions. An order with 'EXP' status shall be reported with the remaining quantity/volume.

MAC = Matched. The order's quantity/volume has been fully matched (filled) by another order. An order with 'MAC' order status contains the total matched quantity/volume (e.g. in Data Field (53) Quantity/Volume) and the transaction time of matching. The same timestamp should be reflected in the corresponding trade record being linked to that order.

PMA = Partial matched. The order's quantity/volume has been partially matched (filled) by another order. An order with 'PMA' status shall be reported with the remaining quantity/volume left for further trading in Data Field (53) together with the matched quantity/volume in the relevant fields in the schema. In addition, the matched quantity/volume shall be populated in the corresponding trade record which has the same transaction timestamp as the matched order to which it is linked. For further information on reporting the quantity information for order status 'PMA', Annex I to the TRUM shall be consulted.

REF = Refilled. The order has had the hidden or undisclosed quantity refilled to provide visible volume for the order to trade. For example, if Data Field (17) Order condition indicates that an order has hidden volume ('HVO'), for example an 'iceberg' order, and provided that the total quantity/volume has been refilled from the undisclosed volume (indicated in Data Field (21)) as a consequence of the execution of the disclosed volume (visible to the market), this will be reported as a lifecycle event with Action type M for 'modify' to indicate the change in the status of the order to 'REF'.

SUS = Suspended. An order which has been temporarily or permanently suspended from trading by the system (e.g. an exceptional event of IT system failure) or by the OMP (e.g. due to the suspension of a trading agent or trading portfolio), but not by the market participant. An order with status 'SUS' shall be reported with the suspended quantity/volume in Data Field (53).

WIT = Withdrawn. An order has been withdrawn from the market by the market participant based on a business decision. An order with status 'WIT' shall be reported with the withdrawn quantity/volume in Data Field (53).

Data Field (19) Minimum execution volume

No	Field identifier	Description
19	Minimum execution volume	The field indicates the quantity/volume of any defined minimum execution.
Representation in electronic format		
	<minimumExecuteVolume>	OrderList

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of five decimals	Number	20	100

Field description

This field identifies the minimum execution volume of the order which has to be matched for the order to be executed.

This field shall only be populated if the order condition reported in Data Field (17) indicates 'MEV' for 'Minimum Execution Volume'.

The minimum execution volume of the order shall be expressed in the same unit of measurement in which the quantity or energy volume (delivery capacity) for the contract reported in Data Field (53) Quantity/Volume has been expressed, i.e. the same unit of measurement to be adopted as the one reported in Data Field (56) Quantity unit for fields 53 and 54.

Data Field (20) Price limit

No	Field identifier	Description
20	Price limit	The field indicates the price limit for the order to enter or withdraw from the order book, such as for a trigger or stop-loss order.
Representation in electronic format		
	<priceLimit>	*triggerDetails* section in the OrderList

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of five decimals	Number	20	58.6

Field description

This field identifies the defined price limit for a trigger or stop-loss order that causes the order to either be entered into or to be withdrawn from the order book.

This field is applicable if the order condition reported in Data Field (17) Order condition is 'PTR' for 'Price Trigger' or 'SLO' for 'Stop Loss'.

Data Field (21) Undisclosed volume

No	Field identifier	Description
21	Undisclosed volume	The field indicates the volume that is not disclosed to the market for the order.
Representation in electronic format		
	<undisclosedVolume>	*quantity* section in the OrderList
	<undisclosedVolume>	*clickAndTradeDetails* in the TradeList

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of five decimals	Number	20	1000

Field description

This field identifies the undisclosed or hidden volume of the order identified in Data Field (15) Order ID as provided to the OMP. The volume entered in this field is the volume of the order which is not visible to the market.

This field applies to those orders that have an order condition reported as 'HVO' for 'Hidden volume' in Data Field (17) Order condition, for example, for iceberg orders.

The undisclosed volume of the order shall be expressed in the same unit of measurement in which the quantity or energy volume (delivery capacity) for the contract reported in Data Field (53) Quantity/Volume has been expressed, i.e. the same unit of measurement as the one reported in Data Field (56) Quantity unit for fields 53 and 54.

At a schema level, Data Field (21) is placed in the *quantity* section in the OrderList as schema field 'undisclosedVolume'. This implies that if an active order available for trading has a visible and also a hidden volume, these values should be represented in the *quantity* section via schema fields 'visible' and 'undisclosedVolume', respectively, while indicating the value '0' (zero) in schema field 'matched' (the latter is to be used in the case of partial matching of the order).

For more information on how to report hidden quantity, see guidance under Data Field (53) and Annex I to the TRUM.

The field is considered applicable to orders placed on continuous markets.

Data Field (22) Order duration

No	Field identifier	Description
22	Order duration	The field indicates the order duration which is the time for which the order exists within the system until it is withdrawn or cancelled, unless it is executed.
Representation in electronic format		
	<orderDuration>	OrderList

Description of accepted values	Type	Length	Examples
DAY = Day GTC = Good Till Cancelled GTD = Good Till Date GTT = Good Till Time SES = Session	Text	3	SES

Field description

This field identifies the duration of the order, i.e. the time period in which the order exists in the order book until it is expired or cancelled, unless gets executed. For example, an order can be active during the trading session for the day (value 'DAY' would be applicable) or until it is cancelled (value 'GTC' would be applicable).

For the reporting requirements on how to report the end of the order's lifecycle, see Annex I to the TRUM.

The field is always mandatory for orders to trade.

Description of the accepted values

DAY = Day. An order which persists for the current day only.

GTC = Good till cancelled. The order persists until the market participant cancels it or until it reaches the system maximum duration.

GTD = Good till date. The order persists until a specified date.

GTT = Good till time. The order persists until a specified date and time.

SES = Session. The order persists only within the current trading session or until gate closure.

6.3. Data fields related to contract details

Data Field (23) Contract ID

No	Field identifier	Description
23	Contract ID	The field identifies the contract to which the transaction refers by using the unique code identifier provided by the OMP or counterparties.
Representation in electronic format		
	<contractId>	ContractList

Description of accepted values	Type	Length	Examples
Up to 50 alphanumerical digits	Alphanumeric	50	AGHDN15832839

Field description

The field identifies the contract to be traded to which the reported transaction relates by a unique identifier.

The field is mandatory for all transactions reported in Table 1.

OMP transactions

This field identifies the unique ID of the contract as provided by the OMP where the contract is traded. The contract ID must be specific to the relevant OMP, which means that it shall not be shared with any other contract within the same OMP.

The OMP must have only a single contract identifier for the contract during its lifetime. The contract ID is needed to link all the orders and trades to a specific contract. This implies that the contract ID must be unique throughout the lifecycle of the related transaction reported, i.e. until the delivery date.

Where an OMP has not yet identified a contract admitted to trade on its venue with a unique ID, it may decide to do so in the following ways, for example:

a. for auction markets: gate closure (+ commodity + delivery point if the exchange organises more than one commodity and/or delivery points);

b. for exchange continuous markets: delivery date (or month) + hours (if needed) (+ commodity and or + delivery point if the exchange organises more than one commodity and/or delivery points);

c. for brokers: delivery point + commodity + delivery date (or month) + hours (if needed).

SIDC and SDAC

For reporting contract ID for contracts traded within SIDC (continuous and auction markets) and SDAC, see Section 2.1.1.

Bilateral trades and executions

Market participants reporting bilateral trades traded outside the OMP or executions concluded under the framework of non-standard contracts (reported in Table 2) are not expected to submit a contract ID. Instead, the default value ‘NA’ for ‘not available’ must be populated in this field.

Data Field (24) Contract name

No	Field identifier	Description
24	Contract name	The field indicates the name of the contract to which the transaction refers as identified by the OMP.
Representation in electronic format		
	<contractName>	ContractList

Description of accepted values	Type	Length	Examples
Up to 200 alphanumerical digits	Alphanumeric	200	XYZ abc day-ahead

Field description

This field identifies the name of the contract as identified by the OMP where the contract identified in Data Field (23) Contract ID is admitted to trade. The contract name should be unique within a particular OMP, but the same name can also be used by other OMPs.

The contract name reported in the transaction report should be the same as used by the OMP advertising the contract in their system to their clients.

In cases where the contract name and the contract ID are the same, both fields should be populated with the same value.

The field is mandatory for all OMP transactions reported in Table 1. For bilateral trades and executions, the pre-specified default value shall be reported.

SIDC and SDAC

For the reporting of the contract ID for contracts traded within SIDC (continuous and auction markets) and SDAC, see Section 2.1.1.

Bilateral trades

In the case of transactions concluded bilaterally with a defined price (i.e. outright or fixed by an index) and quantity reported in Table 1, this field shall be populated with the default value ‘BILCONTRACT’.

Executions

For executions concluded under the framework of non-standard contracts reported in Table 2, specifying at least an outright volume and price, this field shall be populated with the default value ‘EXECUTION’.

Data Field (25) Contract type

No	Field identifier	Description
25	Contract type	The field indicates the type of the contract to which the transaction refers.
Representation in electronic format		
	<contractType>	ContractList

Description of accepted values	Type	Length	Examples
AU = Auction AU_PAB = Pay as bid auction CO = Continuous FW = Forward style contract FU = Future style contract OP = Option style contract OP_FW = Option on a forward OP_FU = Option on a future OP_SP = Option on spread OP_SW = Option on a swap SP = Spread SW = Swap SWG = Swings OT = Other **Applicable to exchange for physical (EFP) and exchange for swaps (EFS):** FW_EFP = Forward for exchange for physical FW_EFS = Forward for exchange for swaps FU_EFP = Future for exchange for physical FU_EFS = Future for exchange for swaps **Applicable to PPAs:** SO_PPA = Spot contract concluded under a PPA FW_PPA = Forward contract concluded under a PPA FU_PPA = Future contract concluded under a PPA OP_PPA = Option contract concluded under a PPA SP_PPA = Spread contract concluded under a PPA SW_PPA = Swap contract concluded under a PPA	Text	Up to 6	FW

Field description

This field identifies the type of the contract to which the reported transaction refers.

The field is mandatory for all transactions reported in Table 1.

OMP transactions

For contracts traded in continuous or auction markets at exchanges, the value of 'AU' (for auction) or 'CO' (for continuous on exchange) shall be reported respectively, unless the contract type is one of the other types included in the list of accepted values.

Only in exceptional cases where none of the accepted values are applicable to the contract, then 'OT' (other) should be used.

Regarding the differentiation between forwards and futures, futures that can be physically or cash settled can only be traded on exchanges.

Orders on spreads

When market participants' trade period, contract or product spreads, the transaction is considered to refer to two different master agreements. The order placed should be reported as a spread order indicated as 'SPR' for 'Spread' in Data Field (16) Order type. In addition, Data Field (25) Contract type

should be populated with 'FW' (in case the underlying contracts are forward contracts). The order may result in a trade, which needs to be linked to the spread order and reported in two trade legs.

It is ACER's understanding that when dealing with a spread contract settled financially, the transactions are typically represented by **one legal agreement**. In such a case, Data Field (25) Contract type is expected to be populated with 'SP' ('Spread').

Pay-as-bid auctions

For the related reporting requirements on pay-as-bid auctions, see Section 2.1.1.4. Value 'PAB' shall be used for both the final orders submitted to the auction and the concluded trades.

Bilateral trades

For bilateral trades contract types 'AU' or 'CO' shall not be used. 'FW' (for forward-style contract) refers to the forward style which also includes spot transactions. Market participants should not understand forward style as a sort of derivative contract, but as the style of the contract itself, i.e. for physical delivery at a later date.

Forward-style contracts

In case an equivalent of an exchange-listed futures contract is agreed bilaterally between market participants (or through a broker) it is understood that the traded contract is rather considered a forward contract (since the trading does not take place on the listing exchange), hence, upon its REMIT reporting such contracts are expected to be flagged as 'FW' in this field.

Swaps and spreads

Physical swaps or spreads are usually executed under two master agreements, and they should be reported as separate contracts. However, where such a transaction is represented by **one legal agreement**, then market participants should report it as 'SW' for swap contract, or 'SP' for spread contract, using one of the examples available in Annex II to the TRUM.

Spread contracts typically involve price differences in forwards / future / option prices, and rates, based on intermarket relationships (time differences (maturities), locational differences, commodity differences). Spreads can be established by taking a position in one contract (first leg) and simultaneously taking an opposite position in another contract (second leg). However, spreads might also refer to trading based on pure price difference with an index or reference price.

Swap contracts typically indicate a contract that settles with multi-periods and results in exchange of a series of cash flows. It may for example involve one market participant having a fixed-price contract for an energy commodity, while the other counterparty takes on the floating price of the same commodity. However, floating-to-floating trades may also occur, along with physical/geographical swaps where the hedging is based on different pricing in different locations.

Exchange for physical and exchange for swaps

Exchanges may offer to its clients the possibility to use trade types as exchange for physical and exchange for swap, standing for the following.

- **Exchange for physical (EFP).** An EFP is a bilaterally negotiated transaction involving the simultaneous exchange of an exchange futures position for a corresponding related cash or physical position. In such a transaction the buyer (seller) of the futures transaction is the seller (buyer) of a corresponding amount of the cash commodity, as appropriate, at a price mutually agreed upon.
- **Exchange for swaps (EFS).** An EFS is a bilaterally negotiated transaction involving the simultaneous exchange of an exchange futures position for a corresponding related OTC swap or other OTC derivative in the same or related product.

Such trades are published on the screen with a volume and price. The trade type flag identifies that a trade is a block, an EFP or an EFS trade, to allow the market to understand the differences in the trade types.

Transactions related to EFP or EFS shall be flagged in Data Field (25) Contract type as FU_EFP, FW_EFP, FU_EFS or FW_EFS, respectively.

Power purchase agreements

When reporting a non-standard contract concluded under a PPA in Table 1 (provided the contract specifies fixed volume and delivery profile), market participants shall populate Data Field (25) Contract type with one of the values only applicable to PPAs, for example FW_PPA, in order to flag in the report that the contract refers to a PPA.

When reporting executions in Table 1 concluded under PPA-related non-standard contracts previously reported in Table 2, the contract record in Table 2 shall indicated the respective PPA valued in Data Field (12) Contract type. Given that the related execution report shall always be linked to the Table 2 non-standard contract via Data Field (39) Linked transaction ID, it is sufficient to flag the contract type of the execution as 'FW' in this field. For more information on reporting PPAs, see Section 2.2.2.

Transactions related to options traded on an OMP or bilaterally

In ACER's understanding, there are at least three different types of contracts with optionality:

1. options with given strike price(s) and traded at OMPs;
2. options with given strike price(s) and traded bilaterally;
3. option with complex price structure.

If the option contract is traded on an OMP, it shall be reported in Table 1 irrespective of the strike price being fixed by an outright price or a price formula.

Once the option is exercised, the resulting trades are considered reportable and shall be linked to the original transaction via Data Field (39) Linked transaction ID.

If the option contract has a complex price structure but a fixed delivery point and fixed quantity, Table 1 may be used for the reporting, but Action type M shall be sent when the final price is available. Otherwise, Table 2 shall be used.

Data Field (26) Energy commodity

No	Field identifier	Description
26	Energy commodity	The field indicates the energy commodity subject to the contract to which the transaction refers.
Representation in electronic format		
	<energyCommodity>	ContractList

Description of accepted values	Type	Length	Examples
EL = Electricity NG = Gas LG = Liquified natural gas	Text	2	NG

Field description

This field identifies the energy commodity of the product included in the contract that the reported transaction refers to. The energy commodity that falls under the scope of REMIT may be electricity, natural gas or LNG. Other commodities, such as emissions rights, coal and oil, are out of scope of REMIT.

The field is mandatory for all transactions reported in Table 1.

Reporting spreads

Spark spreads involve one leg for the electricity trade and one leg for the gas trade, which has to be reported separately but should be linked via Data Field (39) Linked transaction ID. In the case of a clean spark spread, the emission leg shall not be reported.

Where one or more elements of a spread is not gas or electricity, only the gas or electricity leg of the spread shall be reported. For example, for clean and dirty dark spreads, coal and emissions legs shall not be reported in the REMIT transaction reporting framework. In this case, the electricity trade does not need to be linked to other transactions in Data Field (39).

Data Field (27) Fixing index or reference price

No	Field identifier	Description
27	Fixing index or reference price	The field indicates the fixing index that sets the price for the contract or the reference price for derivatives. The fixing index is expected to follow the naming convention specified by the Agency.
Representation in electronic format		
	<indexName>	ContractList
	<indexName>	*fixingIndex* section in OrderList/TradeList

Description of accepted values	Type	Length	Examples
Up to 150 alphanumerical digits	Alphanumeric	150	XYZ abc day-ahead

Field description

This field identifies the name of the index used to fix the price of the traded contract as reported by the publisher or the reference price used to settle the price of the contract related to derivatives. If a fixing index or a reference price is reported in this field, then Data Field (45) Price is not considered applicable.

The index value, and the related currency, of the index or reference price shall be reported in Data Field (48) Index value as per the requirements provided under that data field.

In general, it is not considered a lifecycle event when the value of the public fixing index becomes available.

When reporting the name of the fixing index or indices in this field, reporting parties are expected to refer to available industry standards and apply such standards in their REMIT reporting.

The field is mandatory for all transactions where the price of the contract is fixed by an index.

If the price is fixed by a complex formula including multiple indices, all indices shall be reported in this field, while Data Field (46) Price formula shall specify the formula setting the relation for the applicable of the indices. In such cases, the outright price of the transaction, once available shall be reported in Data Field (45). For further information, see also Annex I to the TRUM.

Irrespective of whether it is traded bilaterally or on an OMP, if the price of the trade is fixed by an index or a deviation from an index, Table 1 is to be used provided the quantity and the delivery profile is fixed. In case there is a deviation from the fixing index, it shall be reported in Data Field (46) Price formula. The index value is to be reported in Data Field (48).

If the price is based on a formula by using a combination of indices, the trade may be reported in Table 1 provided it entails a fixed volume and delivery profile. However, once the final price is available, it

shall be reported in Data Field (45) Price as a lifecycle event by using Action type M. If the trade also has volume optionality or option to choose over the delivery, it shall be reported in Table 2.

Example 1: Complex index

A market participant buys an electricity forward contract (with fixed quantity) from a counterparty. The contract price is expressed by the following formula/basket index with multiple indices:

50 % electricity daily index base spot exchange X + 50 % electricity month futures base exchange X.

The market participant is expected to report the bilateral trade by using Table 1, indicating the name of both indices in this field and the price formula in Data Field (46). The price formula should mimic the index reported and provide information as accurately as possible. Once the final price is known, it shall be reported in Data Field (45) as a lifecycle event by using Action type M.

Example 2: Simple formula

A market participant buys an electricity forward contract from a counterparty with a fixed quantity. The contract does not have a fixed price, but uses the following single index with a simple formula (i.e. deviation from the fixing index):

EUR 2/MWh + electricity daily index base spot exchange X.

The trade shall be reported using Table 1 and the price differential of EUR 2 ('+ 2') shall be indicated in Data Field (46) Price formula.

Example 3: Single index without a formula

Some contracts are traded on the basis that the price will be fixed by an index value or reference price upon its publication. The market participant trades a day-ahead gas/electricity contract on a broker platform at 11:00 am with fixing index 'ABCD day-ahead EU gas'. The index price will be published later in the day by the ABCD publisher, and that price will be used to settle the contract. Hence, the actual price is not known when the trade is agreed. Since the trade is concluded on a broker-type OMP, Table 1 shall be used for the reporting by populating this field with the name of the fixing index.

If the value of the fixing index is not available at the time of the trading, Data Field (48) Index value is not considered applicable (lifecycle reporting is also not required upon the publication of the index provided the index value is publicly available).

Transactions related to derivatives

For derivatives, this field identifies the name or code (if available) of the underlying used for fixing the price of the traded contract. If a code is available, this field shall contain the code of the ultimate underlying instrument. For example, a financial swap on two gas future contracts (e.g. two different delivery points) should have the name or the underlying code for the two futures.

As far as ACER is aware, contracts that reference an index or indices which are used in order to determine settlement prices are available to the OMPs.

If the index is not publicly available, reporting parties should strive to minimise any discrepancy between the two counterparties when reporting this information.

For derivatives that have not been reported under EMIR, and are therefore reported under REMIT, the following buyer and seller logic should apply. For example, in the case of a fixed-to-floating derivative, if party X buys a swap, then party X pays a fixed price, and party Y pays a floating price. This means that party X receives the floating leg and party Y receives the fixed leg. X will be identified as a buyer (B) and Y will be identified as a seller (S).

In the case of a floating-to-floating derivative, if party X buys a swap, party X pays the floating price of the first leg (or index) and party Y pays the floating price of the second leg (or second index). In this case, legs (indices) should be sorted alphabetically. X will be identified as a buyer (B) and Y will be identified as a seller (S).

Reporting in index trades in the electronic format

In the REMITTable1 schema the element 'indexName' is present in the ContractList, OrderList and TradeList. Any fixing index adopted for fixing the price of a contract has to be indicated in the ContractList in the schema.

The purpose of the 'indexName' element in the OrderList and TradeList is to specify to which fixing index the values in the 'indexCurrValue' element group refer in cases where more than one fixing index is used for fixing the price of the traded contract. It is not mandatory to populate the 'indexName' in the OrderList and TradeList when there is only one fixing index used to fix the price of the contract.

Data Field (28) Fixing index types

No	Field identifier	Description
28	Fixing index types	The field indicates the type of the fixing index, such as spot, forward, swap, spread, etc.
Representation in electronic format		
	<fixingIndexType>	*fixingIndexDetails* section in the ContractList

Description of accepted values	Type	Length	Examples
SO = Spot FW = Forward style contract FU = Future style contract OP = Option style contract OP_FW = Option on a forward OP_FU = Option on a future OP_SW = Option on a swap SP = Spread SW = Swap INX = Index	Alphanumerical	Up to 3	FW

Field description

This field identifies the type of fixing index indicated in Data Field (27) used in the contract which the reported transaction refers to. Where the contract has several fixing indices with different types, the index type shall be identified for each of them in the transaction report.

The field shall be applicable in case the fixing index used in the contract is not publicly available.

For example, if the index is a spot price published by an exchange, value 'SO' for 'spot' shall be reported. If the index is published by a price-reporting agency or other publisher and it represents the delivery of the energy commodity during a specific day, week, weekend, month, etc., then value 'FW' for 'forward' shall be reported. If the index is a future price published by an exchange, the value 'FU' for 'future' value shall be reported.

Value 'INX' shall be used when the index is not linked to traded contracts but represents calculated values.

Data Field (29) Fixing index sources

No	Field identifier	Description
29	Fixing index sources	The field indicates the publication source for each index. In case of basket of indices for

		which no unique identifier exists, the basket or the index shall be indicated.
Representation in electronic format		
	<fixingIndexSource>	*fixingIndex* section in the ContractList

Description of accepted values	Type	Length	Examples
Up to 100 alphanumerical digits	Alphanumeric	100	Index source name

Field description

This field identifies the source of the fixing index reported in Data Field (27). Where the contract has several sources for the fixing indices each source should be reported in this field.

The field shall be applicable in case the fixing index used in the contract is not publicly available.

For each index reported in Data Field (27), the publication source of each index shall be specified in this field. In the case of a basket of indices for which no unique publisher exists, all sources of the basket of indices shall be reported.

For example, if in Data Field (27) index 'EU-GAS-CALENDAR-YEAR-2026-PUB-NAME' is reported, the source of the index publication, for example, the EUGAS-PRICES-PUB-NAME and the publisher's name, such as PUB-NAME, is expected to be reported in this field.

Data Field (30) Index fixing interval

No	Field identifier	Description
30	Index fixing interval	The field indicates the fixing interval determining the earliest and latest fixing date of the fixing index.
Representation in electronic format		
	<firstFixingDate>	*fixingIndexDetails* section in the ContractList
	<lastFixingDate>	

Description of accepted values	Type	Length	Examples
ISO 8601 date format	Date	n/a	2026-01-29

Field description

This field identifies the first and last date at which the price of the contract can be fixed by using the index reported in Data Field (27).

The field shall be applicable in case the fixing index used in the contract is not publicly available.

If the contract has several indices and each of them may be used to set the contract price, for each of them the first and last date at which the price of the contract can be fixed shall be reported in this field.

Data Field (31) Fixing frequency

No	Field identifier	Description
31	Fixing frequency	The field indicates the frequency of the fixing event, such as daily, weekly, monthly, seasonal, annual or other.
Representation in electronic format		
	<fixingFrequency>	*fixingIndexDetails* section in the ContractList

Description of accepted values	Type	Length	Examples
X = Half hourly H = Hourly D = Daily W = Weekly M = Monthly Q = Quarterly S = Seasonal A = Annual O = Other	Text	1	W

Field description

This field identifies the frequency of the fixing of the index used to fix the price of the contract reported in Data Field (27).

The fixing frequency shall not be understood as the exact date(s) and time(s) when the fixing can occur, but its frequency, which may occur with a daily, weekly, monthly, seasonal, annual or other frequency.

The field is mandatory for transactions where the price of the contract is fixed by an index and reported in Data Field (27).

The field shall be applicable in case the fixing index used in the contract is not publicly available.

Data Field (32) Settlement method

No	Field identifier	Description
32	Settlement method	The field indicates whether the contract is settled physically or in cash, and whether the parties had an option over the settlement method.
Representation in electronic format		
	<settlementMethod>	ContractList

Description of accepted values	Type	Length	Examples

P = Physically settled without optionality	Text	1	P
C = Cash settled without optionality		1	
P_OP = Physically settled with optionality		4	
C_OP = Cash settled with optionality		4	

Field description

This field identifies the type of the settlement method applied for the contract the reported transaction relates to. The way the contract shall be settled, i.e. physically or financially, is pre-specified in the contract specifications as advertised by the relevant OMP.

Contracts reportable under REMIT normally refer to physical delivery in the EU. In the case of derivatives, if reported under REMIT, the market participants trading the contract may have optionality over the settlement method. In such a case the actual settlement method chosen by the market participant shall be reported in this field by also reflecting the fact that the market participant had the optionality to choose over the settlement.

The field is mandatory for all transactions reported in Table 1.

Description of accepted values

P = Physically settled without optionality. Value 'P' shall be reported for contracts that are settled physically (typical for spot/physical forwards). The field shall also be populated with 'P' in the case of derivatives contracts relating to a wholesale energy product that must be physically settled. For contracts such as options on forwards/futures/swaps, the option settles into the underlying forward/future/swap. Since the underlying contract is considered for physical delivery, the value of 'P' shall be reported.

C = Cash settled without optionality. Value 'C' shall be reported for contracts that are settled in cash without an optionality, i.e. must be settled in cash.

P_OP = Physically settled with optionality. Value 'P_OP' shall be reported for contracts that are physically settled while the market participant had an optionality over the settlement method.

C_OP = Cash settled with optionality. Value 'C_OP' shall be reported for contracts that are cash settled while the market participant had an optionality over the settlement method.

Data Field (33) Organised marketplace ID/OTC

No	Field identifier	Description
33	Organised marketplace ID/OTC	The field identifies by a unique code the organised marketplace used by the market participant for the placing or conclusion of the transaction. In case of LNG market data, the field may also identify the platform where the bid or offer was placed or registered, or where the transaction was concluded.
Representation in electronic format		
	<organisedMarketPlaceIdentifier>	ContractList/OrderList/TradeList
	<sourceOMPID>	TradeList

Description of accepted values	Type	Length	Examples

LEI MIC ACER code XBIL = bilateral trade	Alphanumeric	20 4 12 4	1234567890abcdefrgf MICX C0643278W.EU XBIL

Field description and cardinality

This field identifies by a unique code the OMP where the reported order was placed, or the reported trade was concluded. In the case of bilateral trades, including executions, a default value shall apply.

Schema field <sourceOMPID> shall be applicable when exchange OMPs report cleared trades originally concluded on broker-type OMPs or bilaterally. For more information, see Section 2.1.2.4.

The field is mandatory for all transactions reported in Table 1.

OMP transactions

If the transaction was placed or concluded on an OMP, the OMP shall identify itself in this field by using one of the accepted codes, such as the LEI, the MIC or the ACER code, as provided to ACER's List of organised marketplaces.

Bilateral trades and executions

For bilateral trades and executions concluded under the framework of non-standard contracts, value 'XBIL' shall be populated in this field by default.

Data Field (34) Type of trading venue

No	Field identifier	Description
34	Type of trading venue	The field indicates the type of trading venue operated by the organised marketplace where the placing or conclusion of the transaction occurred.
Representation in electronic format		
	<typeOfTradingVenue>	ContractList

Description of accepted values	Type	Length	Examples
RM MTF OTF	Text	2 3 3	OTF

Field description

The field shall identify the type of the trading venue as defined by Article 4(1) of Directive 2014/65/EU ([17]) (MiFID II) where the transaction has been placed or executed. This implies that when reporting transactions related to derivatives under REMIT, the OMP where the transaction was placed or concluded shall be identified in Data Field (33) by one of its codes as available in ACER's 'List of organised marketplaces', and in addition, the type of trading venue operated by the OMP where the reported transaction has been placed or concluded shall be identified in this field.

([17]) Directive 2014/65/EU of the European Parliament and of the Council of 15 May 2014 on markets in financial instruments and amending Directive 2002/92/EC and Directive 2011/61/EU (recast) (OJ L 173, 12.6.2014, p. 349, ELI: http://data.europa.eu/eli/dir/2014/65/oj).

The field is only mandatory when reporting transactions related to derivatives under Article 3(a)(ii) of the REMIT Implementing Regulation and where the OMP reporting the transaction is subject to Article 4(1) of MiFID II. For any other type of transactions, such as forwards with physical delivery traded on a physical spot market, the field is not considered applicable.

In addition, the field is also not applicable to reporting OTC derivatives (unless already reported under EMIR) since in such case Data Field (33) Organised marketplace ID/OTC shall be populated with value 'XBIL'.

Description of accepted values

RM = Regulated Market. A multilateral system operated and/or managed by a market operator, which brings together or facilitates the bringing together of multiple third-party buying and selling interests in financial instruments, in the system and in accordance with its non-discretionary rules, in a way that results in a contract, in respect of the financial instruments admitted to trading under its rules and/or systems, and which is authorised and functions regularly, as defined under Article 4(1)(21) of MiFID II.

MTF = Multilateral Trading Facility. A multilateral system, operated by an investment firm or a market operator, which brings together multiple third-party buying and selling interests in financial instruments – in the system and in accordance with non-discretionary rules – in a way that results in a contract as defined by Article 4(1)(22) of MiFID II.

OTF = Organised Trading Facility. A multilateral system that is not a regulated market or an MTF, and in which multiple third-party buying and selling interests in bonds, structured finance products, emission allowances or derivatives are able to interact in the system in a way that results in a contract as defined under Article 4(1)(23) of MiFID II.

Data Field (35) Contract trading hours

No	Field identifier	Description
35	Contract trading hours	The field indicates the trading hours of the contract.
Representation in electronic format		
	<startTime>	ContractList
	<endTime>	
	<date>	

Description of accepted values	Type	Length	Examples
ISO 8601 time format using UTC time	Time	n/a	09:00Z/17:00Z

Field description

This field indicates the trading time frame for the contract identified in Data Field (23) Contract ID as set by the OMP. The contract trading hours shall reflect the hours when the market participants can submit orders and when trading can occur in relation to the contract identified in Data Field (23). All contract hours, including the start time and end time, shall be reported in UTC, thus being expressed either in Zulu time, or in local time with indication to the time zone offset.

OMP transactions

In the case of continuous trading, trading hours are in general the opening and closing times for the trading of the specific contract along with any additional restrictions in trading times. In such a case, OMPs shall indicate the trading hours in which their clients may place orders and can conclude trades

in that market (e.g. 09:00Z to 17:00Z). If no restrictions are imposed by the OMP, 00:00Z to 00:00Z shall be reported.

The trading time frame for the contract should represent the hours within which the electronic orders are displayed in the screen (e.g. 09:00 to 17:00, if there are restrictions applied by the OMP). If a voice-brokered trade takes place outside those trading hours, the contract should be reported with the same hours but flagged as voice-brokered in Data Field (41) Voice-brokered by using the applicable value (i.e. on-screen or off-screen).

In the case of auction markets, trading hours are in general 00:00Z to 00:00Z unless the exchange has some restrictions on the time from which orders can be placed on a regular day to the date and time at which orders can no longer be placed, i.e. the last trading date and time in Data Field (36) Last trading date and time.

Bilateral trades

For bilateral trades that occur outside the OMP, default value 00:00Z to 00:00Z shall be reported in this field.

Executions

This field is not considered applicable to executions related to non-standard contracts reported in Table 2.

Data Field (36) Last trading date and time

No	Field identifier	Description
36	Last trading date and time	The field indicates the last trading date and time for the contract.
Representation in electronic format		
	<lastTradingDateTime>	ContractList

Description of accepted values	Type	Length	Examples
ISO 8601 date and time format using UTC	Date and time	n/a	2026-07-31T00:00:00Z 2026-07-31T02:00:00+02:00

Field description

This field indicates the last trading date and time for the contract admitted to trade on OMP to which the reported orders and trades relate, as identified in Data Field (23) Contract ID. The last trading date and time is considered the last point in time when the market participants can submit orders and when trading can occur. The timestamp shall always be represented in UTC, thus being expressed either in Zulu time, or in local time with indication to the time zone offset.

OMP transactions

For auction markets, the gate closure time shall be reported in this field.

For continuous markets and broker-type OMP platforms, this field shall represent the last date and time at which an order can be placed to trade the specific contract as identified in Data Field (23).

If the OMP does not apply any time constraint for the trading of the contract identified in Data Field (23), this field is not considered applicable.

Bilateral trades and executions

This field is not considered applicable to bilateral trades and executions.

6.4. Data fields related to transaction details

Data Field (37) Transaction timestamp

No	Field identifier	Description
37	Transaction timestamp	The field indicates the date and time when the reported transaction event, including the order submission, trade execution and their modification, cancellation or termination, occurred.
Representation in electronic format		
	<transactionDateTime>	OrderList/TradeList
	<executionDateTime>	TradeList
	<originalEntryDateTime>	OrderList

Description of accepted values	Type	Length	Examples
ISO 8601 date and time format using UTC	Date and time	n/a	2026-01-29T10:35:56.050Z 2026-01-29T12:35:56.050+02:00

Field description

This field identifies the transaction timestamp indicating the date and time at which the reported event occurred.

This field must reflect the actual time as accurately as possible reported as a string representation of the ISO 8601 date and time format. The timestamp shall always be represented in UTC, thus being expressed either in Zulu time, or in local time with indication to the time zone offset.

For example, if a trade is concluded at 12:35:56 local time in a country located in the Eastern European Time zone (e.g. Greece) where the time zone offset is equal to + 2 (i.e. two hours ahead of UTC), then the timestamp of the reported transaction has to be expressed in this field in one of the following ways:

- 2026-01-29T10:35:56.050Z (local time being converted to Zulu time); or
- 2026-01-29T12:35:56.050+02:00 (local time reported with the indication to the offset).

The field is mandatory for all transactions reported in Table 1.

OMP transactions

The transaction timestamp reported in this field shall reflect the same time granularity as used in the OMP's system. This means that if the OMP's trading system operates in milliseconds, the timestamp should be reported in millisecond granularity. For example, if an order was placed in the order book at 14:45:23.123, the timestamp with the same granularity shall be reported in this field. Any rounding must be strictly avoided.

For orders placed on continuous markets, the transaction timestamp is considered the time at which the order was placed, or any subsequent lifecycle event of the order occurred. If the order is partially matched in several consecutive steps, these business events should be accurately reflected via the timestamp in the order's lifecycle events. In the case of trades, the transaction timestamp is the time at which the orders were matched, and the resulting trades were concluded, or when any subsequent lifecycle event of the trade occurred.

For orders placed on auction markets, the transaction timestamp shall reflect the time at which the final orders were placed (i.e. no later than the gate closure time reported in Data Field (36) Last trading date and time) and considered for the auction. In the case of trades concluded based on the auction result, the transaction timestamp is considered the time of the announcement of the auction results or any potential lifecycle event of the trade.

In the case of coupled markets, the transaction timestamp shall reflect the timestamp provided by the centralised coupling system. For further guidance on reporting the transaction timestamp for continuous and auction markets related to SIDC and SDAC, see Section 2.1.1.

Bilateral trades

For bilateral trades, the date and time at which the bilateral trade was agreed by the two market participants shall be reported in this field. The timestamp shall be rounded to the nearest minute in the UTC format (e.g. 2026-01-29T10:35:00.000Z). However, where market participants are not able to meet the requirement to populate the transaction timestamp field with the actual trading time but report the time at which the trade is entered into their trading system (when this is not materially different from the actual trading time ([18])), market participants are expected to minimise any discrepancy between the actual agreement time and the booking time when reporting the transaction timestamp in their respective leg.

Executions

When reporting executions related to non-standard contracts reported in Table 2, the transaction timestamps reported by the involved market participants may be different. Therefore, this field is expected to indicate the timestamp at which each market participant confirms to the other the final price and the quantity for the transaction executed under the framework of the non-standard contract. Since the exact execution time may not be known by the market participants reporting their own side of the trade, this field should be populated by indicating the date only. As the related schema field has a date–time format, the default time of 00:01:00 UTC can be indicated together with the relevant date.

Trading time not available to the market participants

In exceptional cases it may occur that the trading time is not made available to the market participant (e.g. for back-to-back transactions), hence a default time should be used for the reporting. In such cases market participants shall take reasonable steps to report the actual time that the trade was concluded.

Schema representation

Data Field (37) Transaction timestamp is represented by the following fields in the schema:

- transaction timestamp (<transactionTime>, available in the OrderList/TradeList);
- execution timestamp (<executionTime>, available in the TradeList);
- original entry time (<originalEntryTime>, available in the OrderList).

Execution timestamp

Execution timestamp is part of the TradeList in the electronic format. It can be used to indicate that the legally binding execution takes place shortly after the orders have matched.

For example, for a trade:

- <transactionTime>2026-01-11T15:58:44.593Z</transactionTime>;
- <executionTime>2026-01-11T16:01:15.000Z</executionTime>.

The execution time should be reported if it is different to transaction time. There is no need to report the same timestamp twice.

Original entry time

([18]) To be assessed on a case-by-case basis.

The <originalEntryTime> is part of the OrderList and shall be used to report orders with a unique order ID when the orders are removed from the order book at the end of the day (or trading session) and reintroduced the following day (session):

- <transactionTime>2026-01-11T09:00:00.000Z</transactionTime> (at the opening);
- <originalEntryTime>2026-01-07T12:39:29.469Z</originalEntryTime> (originally placed).

Data Field (38) Unique transaction ID

No	Field identifier	Description
38	Unique transaction ID	The field identifies the transaction by a unique identifier as assigned by the organised marketplace or the trade-matching system, or by the two market participants in case of bilateral transactions to match the two sides of a transaction.
Representation in electronic format		
	<uniqueTransactionIdentifier>	TradeList
	<additionalUtiInfo>	

Description of accepted values	Type	Length	Examples
Up to 50 alphanumerical digits	Alphanumeric	100	1234567890abcdefrgf

Field description

The field shall be populated with the unique identifier of the trade that is to be reported. The way the UTI is to be assigned to the given trade depends on where the trade has been executed. The UTI shall remain unique throughout the lifecycle of the trade.

The field is mandatory for all trades, including bilateral transactions and executions, reported in Table 1.

OMP transactions

For trades concluded on an OMP, this field shall be populated with the UTI of the trade as assigned by the OMP in order to allow for the two sides of a trade (i.e. buy and sell side) to match (where applicable).

1. For auction markets, each trade shall have a different UTI generated by the exchange.
2. For continuous markets on exchanges, the concluded trades shall identify the buy and the sell side of the trade with the same UTI generated by the exchange, for example:
   - if market participant A matches a trade with market participant B, both market participants' trade reports shall have the same UTI (e.g. 123);
   - if market participant A matches a trade with market participants B and C, and market participant A's trade report is considered just one execution, the trade reports of market participants A, B and C shall have the same UTI (e.g. 123);
   - if market participant A's trade with market participants B and C is split into two trades, the trade reports of market participants A and B shall have the same UTI (e.g. 123), and the trade reports of market participants A and C shall have the same UTI (e.g. 567), which is different from the UTI of market participants A and B (123).
3. For broker-type OMPs, the trade reports shall identify the buy side and the sell side with the same UTI generated by the system of the broker-type OMP.

In a matched trade, there should always be two sides of the trade (reported separately) irrespective of being one-to-one, one-to-many or many-to-many matches. This rule does not apply to auction markets where all trades have one clearing price, and this is determined by the auction algorithm for all the market participants at the same time. In these particular market segments, all trades concluded upon the auction results shall have a different UTI to distinguish them from each other. Such requirement shall apply to pay-as-bid auctions as well, where the price of the concluded trades is equal to the price of the respective bids.

In case market participants bilaterally conclude the lifecycle event of a trade that has been originally concluded on an OMP, it is crucial that the market participants use the UTI generated by the OMP for both sides of the trade when reporting the lifecycle event to ACER.

Bilateral trades

In the case of bilateral trades, the UTI shall be assigned and agreed by the two market participants (i.e. the buyer and the seller) being counterparties to the trade.

In order to facilitate the reporting of bilateral contracts, ACER has developed and published an algorithm which enables market participants to generate the same UTI from the economic terms of the bilateral trade.

Therefore, for bilateral trades, ACER recommends that market participants use ACER's UTI generator tool, unless one of the following applies.

1. Market participants agree to submit a UTI which is generated by a publicly available system/guidance. In this case, market participants should bear in mind that it is their responsibility to agree on the division of tasks and their timing and submit the same UTI to ACER.
2. Market participants may agree on how to generate their UTI: for example, they may agree to accept one of the two parties' UTI generation methods and agree on its dissemination and usage. The application of such approach is entirely at their discretion of the market participants.

Executions

In the case of executions, each side (buy and sell) of the execution report shall have a UTI reported in this field. This requirement enables reporting of lifecycle events related to these transaction reports. The UTI can be any identifier the market participant prefers, as long as it is unique for that market participant and not used for other execution reports. It could be, for example, any progressive unique number for the market participant reporting the execution, or the identifier available in their deal capturing systems.

The above implies that there is no expectation that the UTI of the buy side and the UTI of the sell side match for the related execution since the executions shall always be linked to the contract ID of the related non-standard contract reported in Table 2 via Data Field (39) Linked transaction ID of the Execution report.

Generation, dissemination and usage of the UTI

The following table specifies the different scenarios for the generation of the UTI.

How is the trade concluded?	How is the UTI generated?	How is the trade report sent to ACER?	Is there a need for the market participant to generate the UTI?	How are the lifecycle events reported?
On an OMP	OMP	The OMP through its designated RRM.	No	A) The OMP, if the lifecycle event is concluded on the OMP. B) The market participant through its

Bilaterally				designated RRM if the lifecycle event is concluded bilaterally (outside the OMP).
	Market participants	The market participants through their designated RRM. (NB: the market participant may delegate the reporting to its counterparty which shall report through the designated RRM).	Yes	The market participant through their designated RRM.

Use cases for the application of the additional UTI field in the schema

Data Field (38) Unique transaction ID is represented by the following fields in the schema: <uniqueTransactionIdentifier> and <additionalUtiInfo>. The <additionalUtiInfo> can be used in the following cases.

Case 1

In cases where market participants trade bilaterally and are unable to obtain the UTI from their counterparty within the deadlines required for the REMIT reporting, the market participants should submit a temporary UTI in the transaction record reported with Action type N in field <uniqueTransactionIdentifier>. Once they have received the UTI from their counterparty, a lifecycle event of the record with Action type M needs to be submitted to modify the previous report recalling the old UTI. For detailed guidance, see Annex I to the TRUM.

Case 2

The <additionalUtiInfo> field can be used to report the EIC Y code for a delivery point or zone in a non-EU country. For example, if a trade is a cross-border trade referring to an EU delivery point or zone and the Swiss delivery point or zone (or any other non-EU delivery point or zone), then the OMP may report the EIC Y code for the non-EU country delivery point or zone in the <additionalUtiInfo> field. It should be noted that reporting the EIC Y code for a delivery point or zone in the non-EU country is not a REMIT requirement.

Data Field (39) Linked transaction ID

No	Field identifier	Description
39	Linked transaction ID	The field identifies the linked transaction by using a unique identifier that is associated with the execution, or when two or more transactions relate to each other, such as when the option is exercised, or when multiple transactions contribute to the same trading strategy.
Representation in electronic format		
	<linkedTransactionId>	TradeList

Description of accepted values		**Type**	**Length**	**Examples**
Up to 100 alphanumerical digits		Alphanumeric	100	1234567890abcdefrgf

Field description

This field indicates if two or more trades are linked to each other or when an execution is reported that needs to be linked to the related non-standard contract previously reported in Table 2.

The value populated in this field shall be the UTI or the contract ID of the related trade or non-standard contract as identified in Data Field (38) Unique transaction ID in Table 1 or Data Field (10) Contract ID in Table 2, respectively.

Scenarios for the application of the linked transaction ID

The linked transaction ID shall be used in the following scenarios.

1. When a trade occurs across multiple contracts due to the nature of the contracts, for example, a contract which is a spread of two or more contracts falling under the scope of REMIT. The trade for each contract is to be reported, and the different trades are to be linked to each other when they are executed simultaneously on the OMP. Examples include the following.
   a) Clean and dirty spark spreads for a trade that involves electricity and gas: the two trades are reported separately, with one leg for the electricity and one leg for the gas trade. The two legs should be linked together through the linked transaction ID field.
   b) Physical swaps for a trade that involves two gas or electricity trades: a geographical physical swap involves two trades, for example, selling gas in a particular delivery point and buying it at another delivery point. Both trades have to be reported separately and linked together through this field if they are traded simultaneously.
2. When a transaction represents an execution under the framework of a non-standard contract reported in Table 2, the details of the execution specifying at least an outright volume and price shall be reported in Table 1, by linking it to the relevant non-standard contracts by providing its contract ID in this field.
3. When an option is exercised, the resulting trades shall be reported and linked to the original transaction related to the option contract via this field.
4. When reporting sleeve trades, this field shall be used in order to report the UTI of the linked sleeve trade report. For further examples on reporting sleeve trades, see Annex II to the TRUM.

Data Field (40) Linked order ID

No	Field identifier	Description
40	Linked order ID	The field identifies the linked order by using a unique identifier that is associated with the execution or linked to the reported order.
Representation in electronic format		
	<linkedOrderId>	OrderList
	<linkedOrderId>	TradeList

Description of accepted values	Type	Length	Examples

Up to 100 alphanumerical digits	Alphanumeric	100	1234567890abcdefrgf

Field description

This field identifies the order via its unique identification that is associated with the concluded trade identified in Data Field (38) Unique transaction ID. The ID of the order reported in this field in the trade record shall be exactly the same as the ID of the related order identified in Data Field (15) Order ID of the order record.

The field is mandatory for both orders and trades according to the scenarios specified below.

Scenarios for the application of the linked order ID

The linked order ID shall be used in the following cases.

- When an order is matched – in the trade report this field shall be used to identify the order that resulted in the trade.
- When an order has a special condition that links the order to another order, for example, the order type is a block or exclusive order. In such cases, this field shall be populated with the Block ID that is unique across all orders (each being uniquely identified by its own order ID in Data Field (15)) that belongs to the block. In addition, if several blocks of orders are being linked to the same basket, a unique basket ID may be assigned across all blocks (each being uniquely identified in this field by its own basket ID that belongs to the same basket). For further examples, see Annex II to the TRUM.

Type of trades where no linked order IDs are expected

Scenario 1: clearing/trade registration

As explained in Section 2.1.2.4, when transactions concluded bilaterally or on a broker-type OMP are sent for clearing/trade registration, the clearing exchange (OMP) shall report the cleared trades. In this case, the trade takes place on an exchange via clearing/trade registration without orders on screen, therefore this field shall be reported with the value of 'NA' to indicate that there was no visible order. Data Field (43) Transaction type shall be reported with 'CL' for cleared trades.

Scenario 2: exchange-traded contracts with orders placed on a broker-type OMP

In the case of exchange-traded contracts, if the trade takes place on an exchange with orders to trade placed on the broker-type OMP, there is no expectation that the order report and the trade report are linked together as the two were placed and subsequently executed on two different OMPs. This implies that in this specific case, this field is not considered applicable to the trade report.

Data Field (41) Voice-brokered

No	Field identifier		Description	
41	Voice-brokered		The field indicates whether the transaction was voice-brokered.	
Representation in electronic format				
	<voiceBrokered>		TradeList	
Description of accepted values		**Type**	**Length**	**Examples**
On-Screen Off-Screen No		Text	Up to 10	On-Screen

Field description

This field identifies whether the trade was concluded via a voice-assisted system at the broker-type OMP or not.

For any voice-brokered deal on listed products, reporting parties should report the ID of the OMP in Data Field (33) Organised marketplace ID/OTC.

The field is always mandatory for trades reported in Table 1.

Description of accepted values

'On-Screen' is to be indicated in cases where the trade was concluded as voice-brokered while the trade was made visible on the screen to the other market participants.

'Off-Screen' is to be indicated in cases where the trade was concluded as voice-brokered, but the trade was not made visible to the other market participants.

'No' is to be indicated for trades that were concluded without voice-assisted brokering.

Data Field (42) Post-trade event

No	Field identifier	Description
42	Post-trade event	The field identifies if the reported transaction refers to a post-trade event occurring after the conclusion of the transaction, such as give-up, take-up, etc.
Representation in electronic format		
	<postTradeEvent>	TradeList

Description of accepted values	Type	Length	Examples
Give-up Take-up	Text	7	Give-up

Field description

The field indicates the type of post-trade event, characterising the reported trade according to the pre-specified values included as accepted values. A trade that is flagged with a post-trade event type is not necessarily considered as a lifecycle event to the previously reported trade.

The field is applicable to trades where the reported event takes place on an OMP.

The current version of the TRUM requires the flagging of transactions related to give-ups and take-ups as post-trade events in this field. The type of post-trade events and therefore the related list of accepted values may be further expanded at further iterations of the TRUM to reflect market practices with regards to post-trade events.

Give-up and take-up

Reporting of the values 'give-up' and 'take-up' is considered applicable in the context of the following scenario.

A member of an exchange (REMIT market participant) executes, then gives up its trades. The trade executed on the OMP is considered reportable by the OMP including the client's identification in Data Field (10) Beneficiary ID.

Otherwise, if the beneficiary information is not reflected in the trade report reported by the OMP, a back-to-back trade with the client is expected to be reported, flagging the respective legs as 'give-up' and 'take-up' in this field.

It is important to note that give-ups and take-ups in the context of position transfers between two clearing members during the clearing/settlement process are not considered reportable events under REMIT.

Data Field (43) Transaction type

No	Field identifier	Description
43	Transaction type	The field identifies any specific information on the type of the transaction, for example if it represents a cleared trade.
Representation in electronic format		
	<transactionType>	TradeList

Description of accepted values	Type	Length	Examples
CL = Cleared BM = Batch matching ST = Self-trade	Text	2	CL

Field description

The field shall identify whether the reported transaction entails a specific feature to be flagged in the transaction report as per the pre-specified reporting requirements (e.g. when there is a specific feature of the contract the transaction refers to, or the transaction relates to a specific trading arrangement).

Reporting parties shall always refer to the latest version of this document for the transaction types that ACER would expect to be flagged in the transaction report.

Description of accepted values ([19])

CL = Cleared. When a trade previously agreed on a broker-type OMP or bilaterally is registered/cleared on an exchange, the registered/cleared trade shall be reported with value 'CL' in this field. For more information on how to report cleared trades, see Section 2.1.2.4.

BM = Batch matching. Within the SIDC an increase in cross-border capacity may lead to the coupling of two order books. In such cases, compatible orders initially placed on the individual order books are automatically matched by the trading system via a different matching process, i.e. batch matching, which is referred to as 'mini-auctions'. Such trades shall be flagged as 'BM' in this field. For more information, see Section 2.1.1.1.

ST = Self-trade. OMPs may provide a self-trade functionality in their trading systems that allows market participants to flag to the market when they execute a self-trade. In such cases, the reported trade should be flagged in this field with value 'ST' ([20]). The flag is not considered applicable to bilateral trades.

Data Field (44) Bidding ID

([19]) It is important to note that the described flags for cleared trades, batch matching or self-trades (previously referred to as wash trades) shall no longer be used in the 'extra' field available in the electronic format.

([20]) For further clarification on the terms self-trade, wash-trade and cross-trade, see ACER Guidance Note 1/2017.

No	Field identifier	Description
44	Bidding ID	The field identifies the bidding unit in case of unit-based bidding or the portfolio in case of portfolio-based bidding, by using a unique identifier.
Representation in electronic format		
	<biddingId>	OrderList/TradeList

Description of accepted values	Type	Length	Examples
Up to 50 alphanumerical digits	Alphanumeric	50	12345abcdef

Field description

The field shall identify by a unique code the unit (asset) or the portfolio based on which the market participant was bidding the electricity at the OMP to buy or sell electricity for the reported transaction.

The field is mandatory for transactions related to unit- or portfolio-based bidding.

Unit-based bidding

In specific auction and continuous markets, when market participants are required to bid the capacity based on the units the reported transactions involving unit-based bidding shall identify the ID of the unit in this field by populating in the field the string 'UID' followed by the ID of the asset.

For example, if the Unit ID code (e.g. in Spanish auction and continuous markets) is identified as ABESC01, Data Field (44) shall be populated with the following value: <UIDABESC01>.

Portfolio bidding

In the case of portfolio bidding, market participants can bid at a portfolio level, this often implies the submission of complex bids or block bids. In such cases, the transactions record shall identify the relevant portfolio through its unique identifier as provided to the OMP where the transaction has been placed and/or executed. When reporting transactions involving portfolio-based bidding, Data Field (44) shall be populated with the string 'PID' followed by the ID of the portfolio, in a similar manner to the example for reporting the unit ID presented above.

Data Field (45) Price

No	Field identifier	Description
45	Price	The field indicates the price per unit. For LNG market data ([21]), the field shall indicate an estimated value in case the price is fixed by a price formula.
Representation in electronic format		
	<price>	*priceOrPriceFormula* section in the OrderList/TradeList

([21]) The reference to LNG market data in the field description is not applicable in the context of the REMITTable1 schema. For more information on LNG market data reporting, see Annex III to the TRUM and the REMITTable1LNG schema.

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of five decimals	Number	20	53.45

Field description

This field identifies the agreed price per one unit of energy as expressed per unit of time in Data Field (53) Quantity / Volume.

For example: an hourly electricity contract is reported by indicating:

- the total units of energy as 50 in Data Field (53) Quantity / Volume;
- the unit of measurement as MWh/h in Data Field (56) Quantity unit (for field 53); and
- the price as 53.45 in Data Field (45) Price with price currency expressed in EUR in Data Field (49) Price currency and unit.

The above example shall be interpreted as if the price for 1 MWh of electricity is EUR 53.45.

For orders, this field represents the bid or offer price for that order. However, it is to be noted that this field is not applicable in the case of MAR and MTL order types reported in Data Field (16) Order type.

If the price of the contract is set by a **fixing index or a reference price** indicated in Data Field (27), or by a deviation from a fixing index (+ or –), i.e. simple formula, this field is not applicable. However, if the price is set by a complex formula as described in Data Field (46), the final price information shall be reported in the field once available, by using Action type M.

In the case of **options**, this field shall be used to report the option premium.

In the case of **spreads**, when reporting an order, the price field should reflect the spread price, and this field should be populated with the spread value only for the leg for which the spread applies with a positive sign. For trades resulting from such orders, the two trades should be reported reflecting the prices of the respective leg related to the applicable contract.

Price per time interval

If a transaction has a load profile with different quantities and/or prices across different time intervals this field is not considered applicable, and the price per time interval shall be specified in Data Field (87) Price/time interval quantity.

Reporting a trade with a negative price

In certain cases, market participants may enter into a trade with a negative price. If the price of the trade is negative, the price information shall be reported with a negative (–) number in this field.

Interpreting the unit of measurement for quantity in relation to the price

If the price is expressed in a certain currency (e.g. EUR) in Data Field (49) Price currency and unit, then, depending on the quantity unit reported in Data Field (56), the unit of measurement in relation to the price information reported in this field shall be interpreted the following way.

Quantity units reported in Data Field (56)	Interpretation of the unit of measurement related to the price reported in Data Field (45)
KW KWh/h KWh/d	EUR/kWh
MW MWh/h MWh/d	EUR/MWh
GW GWh/h GWh/d	EUR/GWh
Therm/d	EUR/Therm
KTherm/d	EUR/kTherm

MTherm/d	EUR/MTherm
cm/d	EUR/cm
tcm/d	EUR/tcm
mcm/d	EUR/mcm
Btu/d	EUR/Btu
MMBtu/d	EUR/MMBtu
MJ/d	EUR/MJ
100MJ/d	EUR/100MJ
MMJ/d	EUR/MMJ
GJ/d	EUR/GJ

Data Field (46) Price formula

No	Field identifier	Description
46	Price formula	The field indicates the price formula. The field shall specify the components of the formula, such as multiplier, quantity threshold, index, product, product's period, calculation start and end period, discount.
Representation in electronic format		
	<priceFormula>	*priceOrPriceFormula* section in the OrderList/TradeList

Description of accepted values	Type	Length	Examples
Up to 1000 alphanumerical digits	Alphanumeric	1000	HGSG/HBS*+578HSH

Field description

The field is considered applicable if the price of the reported transaction is fixed by a formula. In such a case the applicable formula shall be described in this field in a precise manner.

Complex formulas

A complex formula-based price is understood as a price determined according to predefined mathematical expression by specifying how one or more fixing indices or reference prices are combined with agreed adjustments, discounts, coefficients or other parameters.

In the case of complex price formulas, market participants should report a simplified version of the formula, provided a clear reference to all indices part of the formula is reported by specifying the fixed and variable components. All relevant indices shall be reported in Data Field (27) Fixing index or reference price.

Schema field <priceFormula> is a free text field in the electronic format, however, for consistent and meaningful information on the price formula, reporting parties are expected to refer to the indications provided in Data Field (19) Price formula in Table 2.

Example of a complex index: *contract price = 80 % × baseload index + 20 % × peak load index + €1.50/MWh*.

Reporting requirements:

- Data Field (27) shall indicate two values: baseload index; peak load index;
- Data Field (46) shall be populated with the formula: *80 % × baseload index + 20 % × peak load index + €1.50/MWh*.

If complex indices are reported in Table 1, the record shall be updated with the final price by using Action type M once available.

Simple formulas

In REMIT transaction reporting, if the price is fixed by a single index or simply by a deviation (+ or –) from an index, it is considered a simple formula.

In order to fix the price of a trade, market participants often agree on a difference (+/–) from the fixing index price that will be published after the trade occurs. In such a case, while the index is to be reported in Data Field (27), the differential from the fixing index shall be reported in this field.

This implies that in case there is a difference from the value of the fixing index reported in Data Field (27), this field shall be populated with the agreed price differential from the fixing index, including the positive (+) or negative (–) sign respectively (e.g. + 0.05).

The agreed difference (+/–) from the fixing index value may be expressed in currency (e.g. +/– EUR 0.05) or in percentage terms (e.g. +/– 0.1 %). If the price differential is reported in percentage terms, then the value 'PCT' shall be used in Data Field (49) Price currency and unit.

Example of a simple index: *TTF month-ahead price + €1.50/MWh*.

Reporting requirements:

- Data Field (27) shall indicate: TTF month-ahead;
- Data Field (46) shall indicate: + 1.50.

When reporting simple formulas, there is no requirement to update the record with the final price once the index value is published/available.

OMP transactions

It may happen that the price of a standard contract that is admitted to trade on an OMP is fixed by a **formula** (i.e. applying a combination of multiple indices or a single index but embedded in a complex formula). In such a case, when reporting the transaction with Action type N, the price formula shall be specified in this field as indicated for the relevant contract advertised by the OMP. Once the outright price is known, it is essential to update the transaction report as a lifecycle event with Action type M by providing the outright price in Data Field (45). This requirement is not applicable if the price of the advertised contract is fixed by a single index or a simple formula as specified above.

In the case of an option contract that is traded on an OMP or bilaterally, and the strike price refers to an index or a formula instead of an outright price, the option strike price formula shall be reported in this field, instead of Data Field (73). However, once the option strike price is known, it shall be reported in Data Field (73) as lifecycle event with Action type M.

Bilateral trades

For bilateral trades, if the price of a bilateral trade is fixed by a simple or complex formula but specifies a fixed quantity and delivery profile, it may be reported in Table 1.

However, in the case of a complex formula, once the outright price is known, the trade report needs to be updated as a lifecycle event with Action type M by providing the outright price in Data Field (45). The same consideration shall apply for an option contract traded bilaterally with a strike price formula.

Data Field (47) Price in EUR/MWh

The data field is relevant for reporting LNG market data described in Annex III to the TRUM.

Data Field (48) Index value

No	Field identifier	Description

48	Index value	The field indicates the value of the fixing index.
Representation in electronic format		
	<indexValue>	*fixingIndex* section in the OrderList/TradeList

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of five decimals	Number	20	+/– 0.02

Field description

This field identifies the value of the fixing index indicated in Data Field (27) Fixing index or reference price. The index value represents the value of the index at the time the contract was traded. The currency in which the index value is expressed shall be reported in Data Field (49) Price currency and unit.

If the value of the fixing index is not known when the contract is traded, this field is not applicable.

If the value of the fixing index is known when the contract is traded, the index value shall be reported in this field.

For further guidance and examples on the reporting of transactions where an index or reference price is used to fix the price of the traded contract, see Data Field (27).

Differential from the fixing index

In order to fix the price of the trade, market participants often agree on a difference (+/–) from the fixing index price that will be published after the trade occurs, for example by the end of the particular day or month. In such a case the differential from the fixing index shall be reported in Data Field (46) Price formula. For more information, see Data Field (46).

Data Field (49) Price currency and unit

No	Field identifier	Description
49	Price currency and unit	The field indicates the currency and unit in which the price is expressed.
Representation in electronic format		
	<currency>	*priceOrPriceFormula* and *priceIntervalQuantityDetails* in the OrderList/TradeList
	<indexCurrency>	*fixingIndex* in the OrderList/TradeList

Description of accepted values	Type	Length	Examples
ISO 4217 currency codes and additional accepted values with three alphabetical digits: CHF = Swiss franc	Text	3	EUR

CZK = Czech koruna DKK = Danish krone EUR = Euro EUX = Euro cent GBX = Penny sterling GBP = Pound sterling HUF = Hungarian forint ISK = Icelandic króna NOK = Norwegian krone PCT = Percentage PLN = Polish zloty RON = Romanian leu SEK = Swedish krona USD = US dollar			

Field description

This field identifies the currency to be considered for the unit of measurement of the value indicated in Data Field (45) Price and Data Field (87) Price/time interval quantity.

As the value indicated in Data Field (45) indicates the price per unit of energy, the unit of measurement of the price refers to values indicated in Data Field (49) Price currency and unit and Data Field (56) Quantity unit per one unit of time.

If Data Field (45) Price and Data Field (48) Index value are not reported, this field is also not applicable.

If the transaction is priced as a percentage of the value of the fixing index (e.g. +/– 0.1 %), this field should be reported as 'PCT' for percentage.

Example

If the price currency in this field is populated with EUR and the quantity unit in Data Field (56) is populated with MWh/h, the unit of measurement of the value reported in Data Field (45) should be expressed in EUR/MWh.

Data Field (50) Notional amount

No	Field identifier	Description
50	Notional amount	The field indicates the financial value of the transaction.
Representation in electronic format		
	<notionalAmount>	*notionalAmountDetails* in the TradeList

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of five decimals	Number	20	53450.00

Field description

This field identifies the total notional amount value of the trade. The notional amount shall always be reported in absolute value even if Data Field (45) Price is reported with a negative number.

The field is considered mandatory for all trades concluded on an OMP or bilaterally and executions reported in Table 1.

For orders and their lifecycle events, this field is not expected to be reported.

Calculation of the notional amount

The notional amount should be calculated using the following formula:

notional amount = price × volume × number of periods, where:

- price is the defined as the price of the volume as per Data Field (45);
- volume is the quantity of energy as per Data Field (53) Quantity/Volume;
- number of periods is the number of times that quantity is delivered (as derived from the delivery profile) as per Data Field (82) Number of periods.

This can also be calculated using the following formula:

notional amount = price × total notional contract quantity, where:

- price is the defined as the price of the volume as per Data Field (45);
- total notional contract quantity is the quantity of energy as per Data Field (54).

For example, a contract traded for a price of 50 EUR/MWh for a volume of 100 MW delivered for 24 hours (h) has the following notional amount:

50 EUR/MWh × 100 MW × 24 h = EUR 120 000.

Or for a monthly contract:

50 EUR/MWh × 100 MW × 24 h/day × 30 days = EUR 3 600 000.

Notional amount for index trades

Index trades may not have a value for the contract as this type of contract may not have a fixed price available at the time of the trade. Such trades may also include a differential from the published index value which is not available to the OMP. For example, + EUR 0.05 or – 0.1 %.

The index value may be published after the trading hours or in some cases days/weeks/months after the trade, for example, a month forward on an index where the market participant buys gas three months ahead from the trading date (a forward). The price of that forward will be set the day before the delivery starts based on the front month average price of the month before the delivery takes place. For example, a trade occurs in April for the delivery in July; the average front month (July) price in June is calculated on 30 June and the delivery starts on 1 July at the price of the average front month (July) price in June.

This field is not applicable to trades that do not have a known price at the time of the trade. The same applies to any contracts which have a floating leg, for example, gas/electricity financial swaps not reported under EMIR but reportable under REMIT. For example: in April, market participant A enters into an electricity financial swap contract for the month of July. Market participant A is the seller of the swap. Market participant A sells the forward fixed leg in April, and it buys the spot price (based on a reference price) in July. For the fixed leg, the forward price is known today, but the spot price is not known until the end of July. In this case, this field should be left blank.

In some cases (e.g. trade at settlement), reporting parties may be able to calculate the notional amount of the trade and provide the notional amount by the time the REMIT reporting of the trade is due. Such information always provides added value to the transaction record.

Notional amount for option contracts

For the calculation of the notional amount for options, for the calculation of the notional amount the option strike price and not the option premium shall be used.

Data Field (51) Notional amount in EUR

The data field is relevant for reporting LNG market data described in Annex III to the TRUM.

Data Field (52) Notional currency

No	Field identifier	Description
52	Notional currency	The field indicates the currency of the notional amount in field 50.
Representation in electronic format		
	<notionalCurrency>	*notionalAmountDetails* in the TradeList

Description of accepted values	Type	Length	Examples
ISO 4217 currency codes and additional accepted values with three alphabetical digits: CHF = Swiss franc CZK = Czech koruna DKK = Danish krone EUR = Euro EUX = Euro cent GBX = Penny sterling GBP = Pound sterling HUF = Hungarian forint ISK = Icelandic króna NOK = Norwegian krone PCT = Percentage PLN = Polish zloty RON = Romanian leu SEK = Swedish krona USD = US dollar OTH = Other	Text	3	EUR

Field description

This field identifies the currency for the value indicated in Data Field (50) Notional amount. The notional currency shall be provided in the unit as stored in the system of the reporting party.

If Data Field (50) Notional amount is blank, this field is not applicable.

Reporting parties may want to report in a major unit, for example, EUR rather than EUX for euro cent. The reason for reporting the major unit is to avoid unnecessarily large values. For instance, the price for NBP is quoted in pence per therm, but the notional value of the contract may be much bigger (e.g. a gas year forward is 365 days), so it may be more appropriate to have GBP 1 000 000 rather than GBX 100 000 000.

Data Field (53) Quantity/Volume

No	Field identifier	Description
53	Quantity/Volume	The field indicates the total number of units included in the transaction by specifying the number of units available and visible for trading, and the number of units matched.
Representation in electronic format		
	quantity	TradeList
	<matched>	OrderList
	<visible>	
	<fullyVisible>	

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of five decimals	Number	20	100

Field description and cardinality

This field identifies the quantity or energy volume (delivery capacity) for the contract, i.e. the contract size or clip size. The value that shall be reported in this field is the volume per time unit, for example the number of MWh/h or therm/day.

Reporting the quantity information for orders

In the case of orders, this field is intended to represent the matched quantity and the quantity visible and available for trading in the order book.

It is important to note that in the context of multiple matching events in the order's lifecycle (i.e. due to partial matches) the matched volume should not be understood as a cumulative quantity matched over the lifetime of the order. It shall rather represent a matched quantity resulting from that particular matching event reported with Action type M as a lifecycle event.

Example

Market participant A sells 10 MW of electricity at 50 EUR/MWh on the day-ahead market, while market participant B sells 10 therms of gas at 50 EUR/therm on the day-ahead market. In both scenarios, the value of 10 should be reported in this field. The same applies if the contract is an hourly or monthly delivery contract.

In the case of an order with a hidden quantity (e.g. iceberg orders), the overall quantity of the order should be derived as the sum of Data Field (21) Undisclosed volume and Data Field (53) Quantity/Volume.

Price per time interval quantity

If the transaction features different volumes for each delivery interval reported in Data Field (84) Load delivery intervals, Data Field (53) Quantity/Volume shall be left blank while the quantity information per delivery interval shall be specified in Data Field (85) Delivery capacity.

Schema representation of the quantity information in the order report

It is important to note that in electronic format in the OrderList, Data Field (53) Quantity/Volume and Data Field (21) Undisclosed volume are represented in the fields <matched>, <visible> and <undisclosedVolume> available in the *quantity* section. In addition, in the *quantity* section there is also a stand-alone field <fullyVisible> available. The below section describes the scenarios and the application of the different quantity fields in the schema.

- A **group of elements** with sequence fields <matched>, <visible> and <undisclosedVolume>: this section is to be applied in continuous markets when the reported order has a hidden volume (field <undisclosedVolume> is to be used) and/or the order is partially matched. In the case of the latter, the fields 'visible' and 'matched' are to be used, and also <undisclosedVolume> in the case of a hidden volume. This implies that this section of the quantity fields shall be applied in the cases of:
    - order condition 'HVO', and/or
    - order status 'PMA', and/or
    - order status 'REF'.

For more information, see Section 5.2.4 of Annex I to the TRUM.

- **Stand-alone** field <fullyVisible> shall be used in all other cases, irrespective of the market type (such as continuous or auctions), when hidden volume or partial matching is not a feature of the reported order.

The same considerations shall apply to the reporting of the total notional contract quantity in the schema.

Data Field (54) Total notional contract quantity

No	Field Identifier	Description
54	Total notional contract quantity	The field indicates the total number of units of the wholesale energy product, specifying the number of units available and visible for trading, and the number of units matched. For LNG market data the field shall indicate an estimated value in case the contract quantity is specified by a minimum and maximum value in field 76.
Representation in electronic format		
	totalNotionalContractQuantity	TradeList
	<matched>	OrderList
	<visible>	
	<fullyVisible>	

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of five decimals	Number	20	1000

Field description

This field identifies the total notional contract quantity (TNCQ) of the transaction, including orders to trade.

The field is mandatory for all transactions reported in Table 1, unless Data Field (74) Minimum/Maximum quantity and Data Field (75) Minimum/Maximum total notional contract quantity are populated.

Calculation of TNCQ

The TNCQ shall be calculated using the following formula:

TNCQ = volume × number of periods, where:

- volume is the quantity of energy as per Data Field (53) Quantity/Volume or Data Field (85); Delivery capacity; and
- number of periods is the number of times that quantity is delivered (as derived from the delivery profile) as per Data Field (82) Number of periods.

For the correct calculation of the number of periods, especially for products involving granularity less than an hour (i.e. 15-minute or 30-minute MTU), see Data Field (82).

The TNCQ shall always be calculated based on the information on the volume and number of periods as provided in the respective transaction (i.e. order and trade) report. This implies that the TNCQ of an order shall change accordingly if any components of the above formula (i.e. the volume as defined in Data Field (53) and/or the number of periods) are modified throughout the lifecycle of the order. This also implies that that the TNCQ of the trade resulting from the matched order might differ from the TNCQ of the order originally placed.

For example, a contract traded for a volume of 50 MW and delivered for 24 h would have the following TNCQ value:

50 MW × 24 h = 1 200 MWh.

Or for a monthly contract:

50 MW × 24 h/day × 30 days = 36 000 MWh.

Continuing this example, if the above contract was for delivery for 10 hours, the TNCQ would be 500 MWh (*50 MW × 10 h*). However, if the contract will be delivering for 10 hours for 30 days, then the TNCQ value would be 15 000 MWh (*50 MW × 10 h/day × 30 days*).

Schema representation of the TNCQ information in the order report

It is important to note that in electronic format in the OrderList, Data Field (54) Total Notional Contract Quantity and Data Field (21) Undisclosed volume are represented in the fields <matched>, <visible> and <undisclosedVolume> available in the *totalNotionalContractQuantity* section. In addition, in the same section there is also a stand-alone field <fullyVisible> available.

For the correct reporting of the TNCQ information in the schema, see the guidance provided under Data Field (53).

Data Field (55) Total notional contract quantity in MWh

The data field is relevant for reporting LNG market data described in Annex III to the TRUM.

Data Field (56) Quantity unit for fields 53 and 54

No	Field identifier	Description
56	Quantity unit for fields 53 and 54	The field indicates the unit of measurement used for fields 53 and 54.
Representation in electronic format		
	<quantity>	OrderList/TradeList
	<totalNotionalContractQuantity>	OrderList/TradeList

Description of accepted values	Type	Length	Examples
For field 53: KW KWh/h KWh/d MW MWh/h MWh/d GW GWh/h GWh/d Therm/d KTherm/d MTherm/d cm/d mcm/d tcm/d Btu/d MMBtu/d MJ/d 100MJ/d MMJ/d GJ/d **For field 54:** KWh MWh GWh Therm KTherm MTherm cm tcm mcm Btu MMBtu MJ MMJ 100MJ GJ	Text	2 to 8	MW

Field description

This field identifies the unit used for the reported quantity in Data Field (53) Quantity/Volume and Data Field (54) Total notional contract quantity. Since the units for Data Fields (53) and (54) differ, the two different quantity units should be provided according to the above list.

The field is mandatory for all transactions reported in Table 1.

Data Field (57) Termination date

No	Field identifier	Description
57	Termination date	The field indicates the termination date of the transaction, if different from the delivery end date.
Representation in electronic format		
	<terminationDate>	TradeList

Description of accepted values	Type	Length	Examples
ISO 8601 date and time format using UTC	Date and time	n/a	2026-07-31T00:00:00Z 2026-07-31T02:00:00+02:00

Field description

This field identifies the termination date of the trade, when the trade is terminated before the end of its delivery period. This implies that the trade is terminated early, before the delivery end date reported in Data Field (80).

For further guidance on the reporting of the termination date, see Annex I to the TRUM.

6.5. Data fields related to details of LNG market and trade data

The data fields available in this section are relevant only for the reporting of LNG market and trade data described in Annex III to the TRUM:

- Data Field (58) Type of LNG market data,
- Data Field (59) Annual delivery program,
- Data Field (60) Cargo swap,
- Data Field (61) Event type,
- Data Field (62) Loading facility,
- Data Field (63) Vessel identifier,
- Data Field (64) Delivery terms,
- Data Field (65) Portfolio contract price formula,
- Data Field (66) Special arrangement,
- Data Field (67) Reporter's information,
- Data Field (68) Business contact details.

6.6. Data fields related to optionality details

Data Field (69) Option style

No	Field identifier	Description
69	Option style	The field indicates whether the option may be exercised only at a fixed date (European and Asian style), a series of pre-specified dates (Bermudan) or at any time during the life of the contract (American style) or depending on other conditions.
Representation in electronic format		
	<optionStyle>	*optionDetails* section in the ContractList

Description of accepted values	Type	Length	Examples
A = American B = Bermudan E = European S = Asian X = Exotic O = Other	Text	1	B

Field description

This field identifies the option style, usually defined by the dates on which the option may be exercised: American, European, Bermudan, Asian or other.

An American-style option can be exercised anytime during its life allowing option holders to exercise the option at any time prior to and including its maturity date. A European-style option can only be exercised at the maturity date. A Bermudan-style option can only be exercised on specified dates indicated in Data Field (71) Option exercise date or period.

Option style 'X' for 'Exotic' is expected to be used for exotic options such as for swing, binary, barrier, trigger and window options.

Reporting parties should refer to financial markets in order to identify the option style they need to indicate when reporting the relevant transaction under REMIT.

ACER expects reporting parties to use the value 'Other' only in exceptional cases and to notify ACER via the REMIT Query Form in a timely manner in case none of the above-listed accepted values are applicable to the type of transaction/contract they intend to report.

The field is mandatory for all transactions referring to option contracts as identified in Data Field (25) Contract type.

Data Field (70) Option type

No	Field identifier	Description
70	Option type	The field indicates whether the option is a call, put or other.
Representation in electronic format		
	<optionType>	*optionDetails* section in the ContractList

Description of accepted values	Type	Length	Examples
P = Put C = Call O = Other	Text	1	C

Field description

This field identifies the type of right the option holder owns. Value 'P' shall be indicated if the option is a put option and value 'C' shall be indicated if the option is a call option.

In order to facilitate the reporting, reporting parties should refer to financial markets in order to identify the option type they need to indicate when reporting the relevant transaction under REMIT.

If the option holder owns a type of right different from put or call, the value 'O' for 'Other' shall be reported in this field. Nevertheless, reporting parties are expected to consult ACER on the application of option style 'Other'.

The field is mandatory for all transactions referring to option contracts as identified in Data Field (25) Contract type.

Data Field (71) Option exercise date or period

No	Field identifier	Description
71	Option exercise date or period	The field indicates the date or the period when the option is exercised.
Representation in electronic format		
	optionExerciseDateOrPeriod	*optionDetails* section in the ContractList
	<optionExerciseDate>	
	<optionFirstExerciseDate>	
	<optionLastExerciseDate>	

Description of accepted values	Type	Length	Examples
ISO 8601 date format	Date	10	2026-01-29

Field description

This field identifies the date or period at or during which the option holder has the right but not the obligation to buy or sell the commodity or the underlying instrument at a specified price at a specified date or before.

In the case of an American-, European- or Asian-style option, only one exercise date is expected to be reported. In the case of a Bermudan-style option, several dates or a period are expected be reported.

Reporting parties should refer to financial markets in order to correctly report the exercise date/dates.

The field is mandatory for all transactions referring to option contracts as identified in Data Field (25) Contract type.

Data Field (72) Option exercise frequency

No	Field identifier	Description
72	Option exercise frequency	The field indicates the frequency of the volume optionality.
Representation in electronic format		
	<optionExerciseFrequency>	*optionDetails* section in the ContractList

Description of accepted values	Type	Length	Examples
X = One D = Daily W = Weekly M = Monthly S = Seasonal A = Annual O = Other	Text	1	W

Field description

This field identifies the frequency at which the option holder has the right but not the obligation to exercise the option, i.e. to buy or sell the commodity or the underlying instrument at a pre-specified price indicated in Data Field (73) Option strike price.

It is understood that European, American and Bermudan options can be exercised only once (in such cases, value 'X' is to be populated), while for swing options, for example, multiple exercise decisions can be made during the tenor of the contract. In such cases the applicable option exercise frequency, such as weekly, daily, monthly, etc., shall be indicated in this field as it is specified in the contractual terms and within the option exercise period reported in Data Field (71).

The field is mandatory for all transactions referring to option contracts as identified in Data Field (25) Contract type.

Data Field (73) Option strike price

No	Field identifier	Description
73	Option strike price	The field indicates the strike price of the option.
Representation in electronic format		
	optionStrikePrice	*optionDetails* section in the ContractList
	<value>	
	<currency>	
	<unit>	

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxx.yyyyy with a maximum of five decimals	Number	20	125.98

Field description

This field identifies the price at which the owner of the option can buy (in the case of a call option) or sell (in the case of a put option) the energy commodity or the underlying instrument as indicated in the option contract.

If for an option contract that is traded on an OMP or bilaterally, the option strike price is set by a formula (e.g. for Asian options), the formula shall be specified in Data Field (46) Price formula. However, once the option strike price is known, it shall be reported in Data Field (73) as a lifecycle event with Action type M.

The field is mandatory for transactions referring to option contracts as identified in Data Field (25) Contract type.

Data Field (74) Minimum/Maximum quantity

No	Field identifier	Description
74	Minimum/Maximum quantity	The field indicates the minimum and/or maximum total number of units included in the transaction.
Representation in electronic format		
	quantity	*optionDetails* section in the ContractList
	<minimumMaximumQuantity>	

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of five decimals	Number	20	100

Field description

The field shall be applicable in case the transaction that refers to a standard contract traded on an OMP has a volume optionality specifying a minimum and maximum range for the volume to be delivered.

An example of a contract with such a feature is a gas swing deal (e.g. swing options) traded on an OMP that specifies a minimum and maximum hourly quantity. Such a swing deal is typically reported as a transaction related to an option contract in the REMIT reporting.

It is important to note that the transaction resulting from the option exercise is considered reportable with the final quantity and shall be linked to the transaction related to the option contract via Data Field (39) Linked transaction ID.

However, if a trade is concluded bilaterally that entails a volume optionality, it shall be reported in Table 2 together with the related executions in Table 1 by specifying the final quantity.

Both minimum and maximum quantity information are to be reported in the relevant fields in the schema.

The unit of measurement applicable to the quantity information reported in this field shall be indicated in Data Field (77).

Data Field (75) Minimum/Maximum total notional contract quantity

No	Field identifier	Description
75	Minimum/Maximum total notional contract quantity	The field indicates the minimum and/or maximum total number of units of the wholesale energy product.
Representation in electronic format		
	totalNotionalContractQuantity	*optionDetails* section in the ContractList
	<min>	
	<max>	

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of five decimals	Number	20	100

Field description

The field shall be applicable in case the transaction that refers to a standard contract traded on an OMP has a volume optionality specifying a minimum and maximum range for the volume to be delivered. The field shall specify the total number of units of the wholesale energy product, calculated in a similar manner as described in Data Field (54) Total notional contract quantity.

Both minimum and maximum TNCQ information is to be reported in the relevant fields in the schema.

The unit of measurement applicable to the quantity information reported in this field shall be indicated in Data Field (77).

The field is always applicable when Data Field (75) is populated.

Data Field (76) Minimum/Maximum total notional contract quantity in MWh

The data field is relevant for reporting LNG market data described in Annex III to the TRUM.

Data Field (77) Quantity unit for fields 75 and 76

No	Field identifier	Description
77	Quantity unit for fields 75 and 76	The field indicates the unit of measurement used for fields 75 and 76.
Representation in electronic format		
	<unit>	*optionDetails* section in the ContractList

Description of accepted values	Type	Length	Examples
For field 74: KW KWh/h KWh/d MW MWh/h MWh/d GW GWh/h GWh/d Therm/d KTherm/d MTherm/d cm/d mcm/d tcm/d Btu/d MMBtu/d MJ/d 100MJ/d MMJ/d GJ/d	Text	2 to 8	MW
For field 75: KWh MWh GWh Therm KTherm MTherm cm tcm mcm Btu MMBtu MJ MMJ			

100MJ GJ **For field 76:** MWh (only for LNG market data)			

Field description

This field identifies the unit used for the reported quantity in Data Fields (75) and (76). In addition, this field is also considered applicable to Data Field (74). Since the units for Data Fields (74) and (75) differ, the two different quantity units should be provided according to the above list.

Data Field (76) is only applicable to LNG market data (see Annex III to the TRUM).

6.7. Data fields related to delivery profile

Data Field (78) Delivery point or zone

No	Field identifier	Description
78	Delivery point or zone	The field indicates the EIC codes for the delivery points or market areas, complemented by the identification code (such as EAN code) of the respective local connection point where applicable.
Representation in electronic format		
	<eic>	*deliveryPointOrZone* section in the ContractList
	<ean>	

Description of accepted values	Type	Length	Examples
EIC EAN	Alphanumeric	16 13	10YCB-EUROPEU–8

Field description

The field indicates the EIC Y, Z or W type code representing the delivery point or zone of the reported transaction. Only EICs that are included in ACER's List of accepted EICs are allowed to be reported in this field.

The reporting guidance on reporting the delivery point or zone for supply contracts in Table 1 and 2 is available in Section 2.3.

The field is mandatory for all transactions reported in Table 1.

Application of the EAN code

When reporting transactions related to local flexibility products, this field shall be used, in addition to the reporting of the EIC of the relevant balancing zone or market area, to report the locational

information by reporting the applicable EAN code as the unique identification number that links the respective connection point to a specific user/address. For more information on the reporting of local flexibility products, see Section 2.1.3.2.

Data Field (79) Delivery start date

No	Field identifier	Description
79	Delivery start date	The field indicates the start date of the delivery.
Representation in electronic format		
	<deliveryStartDateTime>	ContractList

Description of accepted values	Type	Length	Examples
ISO 8601 date and time format using UTC	Date and time	n/a	2026-07-01T00:00:00.000Z 2026-07-01T00:00:00.000+00:00

Field description

This field identifies the date at which the delivery of the commodity starts as specified in the contract.

For more information on the lifecycle reporting requirements for this data field, see Annex I to the TRUM.

The field is mandatory for all transactions reported in Table 1.

Data Field (80) Delivery end date

No	Field identifier	Description
80	Delivery end date	The field indicates the end date of the delivery.
Representation in electronic format		
	<deliveryEndDateTime>	ContractList

Description of accepted values	Type	Length	Examples
ISO 8601 date and time format using UTC	Date and time	n/a	2026-07-31T00:00:00.000Z 2026-07-31T00:00:00.000+00:00

Field description

This field identifies the date at which the delivery of the commodity ends as specified in the contract.

For more information on the lifecycle reporting requirements for this data field, see Annex I to the TRUM.

The field is mandatory for all transactions reported in Table 1.

Data Field (81) Duration

No	Field identifier	Description
81	Duration	The field indicates the duration of the delivery period.
Representation in electronic format		
	<duration>	ContractList

Description of accepted values	Type	Length	Examples
N = Minutes HQ = 15 minute HH = 30 minute H = Hour D = Day W = Week WE = Weekend M = Month Q = Quarter S = Season Y = Annual O = Other	Text	2	M

Field description

This field identifies the duration of the delivery period of the contracts represented in a generic way. This means that the field is not intended to specify the exact delivery date and time of the product relevant for the contract (as this shall be deducted from the data fields on load delivery intervals, delivery start date and delivery end date) but identifies the tenor of the contract according to the above-described general classification.

The field is mandatory for all transactions reported in Table 1.

Description of the accepted values

HQ = 15-minute. The granularity/intervals for the trading period specify quarter-hour blocks (15-minute MTU) applicable to orders and trades placed/concluded within SDAC and IDAs. See Section 2.1.1.2.

HH = 30-minute. The granularity/intervals for the trading period specify half-hour blocks (30-minute MTU) applicable to orders and trades placed/concluded within SDAC. See Section 2.1.1.2.

N = Minutes. The contract has a delivery in one day for less than an hour. This value is not considered applicable to electricity auctions.

H = Hour. The contract delivers for one hour or several hours only for one day (e.g. block hours). For gas within-day contracts (provided the delivery lasts for one day), duration ‘H’ shall be reported in this field given that for gas within-day contracts the delivery will cover the remaining hours in the gas day.

D = Day. The contract delivers for 24 hours in one day or for several days (e.g. electricity baseload products or delivery of natural gas for the entire gas day), but the delivery happens for less than a week.

W = Week. The contract delivers in one day or for several days, but the delivery happens for less than a month. Value 'W' shall be considered also for balance of the week contracts.

WE = Weekend. The contract delivers for a specified weekend period.

M = Month. The contract delivers for an entire month or for several months, but for less than a year (e.g. monthly baseload, monthly peak-load products). Also, in the case of one hour of delivery on a daily basis for one month, the field should be populated with 'M'. Value 'M' shall be considered applicable also for balance of the month contracts. For executions reported under the framework of Table 2 non-standard contracts, the industry practice typically determines monthly deliveries (due to the monthly invoicing), therefore value 'M' is reported in most of the cases when reporting executions in Table 1.

Q = Quarter. The delivery happens for an entire quarter or for several quarters.

S = Season. The delivery happens over a season, such as winter-season or calendar season.

Y = Annual. The delivery happens for one or several years (e.g. yearly baseload products).

O = Other. ACER expects reporting parties to use the value 'Other' only in exceptional cases and to notify ACER via the REMIT Query Form in a timely manner in case none of the above-listed accepted values are applicable to the type of transaction/contract they intend to report.

Data Field (82) Number of periods

No	Field identifier	Description
82	Number of periods	The field indicates the number of time units when the quantity is delivered (as derived from the delivery profile), applying hourly resolution.
Representation in electronic format		
	<NumberOfPeriod>	OrderList/TradeList

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of eight decimals	Number	20	0.25

Field description

The field shall identify the number of periods (NoP) included in the delivery profile of the contract. The total count of the delivery periods shall be expressed in hourly resolution over which the contracted energy is delivered between the delivery start time and delivery end time reported in Data Fields (79) and (80).

Deriving the correct NoP is relevant for the calculation of Data Field (54) Total notional contract quantity. As indicated in Data Field (54), the TNCQ shall be calculated by using the following formula: *TNCQ = volume × number of periods*.

The field is mandatory for all transactions reported in Table 1.

Calculation of the NoP

For the calculation of the NoP, hourly resolution shall always be applied. For example, for a monthly baseload electricity contract that specifies delivery for the month of January 2026, the value of the NoP to be populated in Data Field (82) is 744.

For products where the delivery interval is less than an hour, for example a 15-minute product for the supply of electricity, the NoP shall be calculated by dividing the delivery interval (e.g. 15 minutes) by one hour (i.e. 60 minutes). Hence, the NoP in the case of a 15-minute product (provided it delivers just one day) shall be equal to 0.25.

Early termination of the trade

If counterparties decide to terminate the trade early during delivery, it is important that the record sent with Action type C for the cancellation includes an updated value for the number of periods adjusted according to the cancellation date. If the early termination occurs before the start of the delivery, there is no need to update the information sent previously in this field.

Data Field (83) Load type

No	Field identifier	Description
83	Load type	The field indicates the type of the delivery profile.
Representation in electronic format		
	<loadType>	ContractList

Description of accepted values	Type	Length	Examples
BL = Baseload PL = Peak-load OP = Off-Peak-load BH = Hour/Block Hours SH = Shaped GD = Gas-Day OT = Other	Text	2	BL

Field description

This field identifies the delivery profile of the contract. It is understood that the delivery profile, hence, the load type of the contract, is defined as per the definition of the OMP where the contract is admitted to trading or as agreed between the market participants in the case of bilateral trades.

The field is mandatory for all transactions reported in Table 1.

Description of accepted values

BL = Baseload. The contracted volume to supply electricity is delivered continuously for all 24 hours of the day. The delivery may last for a single day or for several days.

PL = Peak load. The product is delivered only during the peak demand hours of the day, rather than continuously, like in a baseload contract. Peak hours may vary by Member State, but a common definition in many European power markets is from Monday to Friday, starting from 07:00 or 08:00 until 19:00 or 20:00, respectively (excluding weekends and holidays).

OP = Off-peak load. The product is delivered during all the hours outside the defined peak-load period. Off-peak hours depend on the market, but a common definition in many European power markets is from Monday to Friday, starting from 19:00 or 20:00 until 07:00 or 08:00, respectively, including weekends and holidays.

BH = Bour/block hours. The product is delivered in a predefined set of hours each day (fixed hourly blocks), being different from baseload, peak-load or off-peak delivery profiles.

SH = Shaped. A contract is considered to have a customised delivery profile, i.e. it specifies the amount of energy to be bought or sold in different points in time to allow the market participant to meet their specific needs.

GD = Gas-day. Natural gas is delivered continuously during the day, typically running from 06:00 in the morning to 06:00 in the morning of the next day. For within-day contracts where the delivery of the gas runs from a certain hour of the gas day until 06:00 in the morning of the next day, load type 'GD' is considered applicable.

OT = Other. The value 'Other' shall be used for LNG-related transactions. In general, ACER expects reporting parties to use the value 'Other' only in exceptional cases and to notify ACER via the REMIT Query Form in a timely manner in case none of the above-listed accepted values are applicable to the type of transaction/contract they intend to report.

For the application of the correct load type for a specific product or contract, see examples included in Annex II to the TRUM.

Data Field (84) Load delivery intervals

No	Field identifier	Description
84	Load delivery intervals	The field indicates the time interval for each block or shape.
Representation in electronic format		
	<loadDeliveryStartDateTime>	*deliveryProfile* section in the ContractList
	<loadDeliveryEndDateTime>	
	<intervalStartDateTime>	*priceIntervalQuantityDetails* section in the OrderList/TradeList
	<intervalEndDateTime>	

Description of accepted values	Type	Length	Examples
ISO 8601 date and time format using UTC	Date end Time	n/a	2026-07-01T00:00:00.000Z 2026-07-01T00:00:00.000+00:00

Field description

This field identifies the load intervals for the delivery of the product as specified in the contract.

The field is mandatory for all transactions reported in Table 1.

Reporting of the delivery profile in the electronic format

The load delivery interval shall indicate the exact time interval when the product is being delivered under the traded contract the reported transaction refers to. When reporting the delivery profile in the XML, it is important to note that each non-interrupted interval of the delivery profile shall be reported in a distinct

row of the XML file. This implies that the *deliveryProfile* section with the load delivery intervals (start date time and end date time) in the ContractList is expected to be repeated as many times for as many interrupted intervals are included in the profile of the reported product.

An 'interrupted interval' means that between the delivery start and end date of the contract there are interruptions (i.e. breaks) in the delivery interval of the commodity. For example, a baseload contract with continuous (i.e. non-interrupted) delivery until the delivery end date is considered to be reported as one single interval since there are no interruptions in the delivery period. On the other hand, peak-load and off-peak-load contracts are to be reported by using multiple intervals, since the delivery is not continuous due to breaks between peak and off-peak times.

The above-described reporting requirement shall be applied irrespective of whether the price and/or quantity is different per delivery interval. This implies that Data Fields (85) and (87) can be blank if the price and/or quantity are the same for each interval included in the contract (i.e. reported in Data Fields (45) and (53)). Furthermore, in such a case, <intervalStartDateTime> and <intervalEndDateTime> are to be left blank in the OrderList and TradeList.

For one load delivery interval with constant price and quantity, irrespective of how long the delivery lasts for within that load delivery interval, only one load delivery start time (i.e. when the load delivery starts) and only one load delivery end time (i.e. when the load delivery ends) shall be reported.

Reportable time format for midnight and end of gas day

The load delivery interval is represented in a date–time format in the schema. According to the ISO 8601 standard and the electronic format adopted by ACER, it is expected that when the delivery starts or ends at the beginning or end of the day (i.e. the delivery time refers to midnight), the time information shall be represented as 00:00:00. However, depending on whether a start time or an end time has to be reported for delivery intervals, different date information shall be adopted.

When trading **electricity**, the delivery start time shall be reported as 00:00:00 on Day X if the delivery starts at the beginning of Day X. For the delivery end time, if the delivery ends at midnight of Day Y (i.e. end of the day of Day Y), the delivery end time shall be expressed as 00:00:00 of Day Y+1. For example, for a typical yearly electricity baseload contract, where the delivery starts at the beginning of 2026-01-01, the delivery start date and time shall be expressed as 2026-01-01T00:00:00.000+02:00. The delivery end date and time shall be expressed as 2027-01-01T00:00:00.000+02:00.

When trading **natural gas**, the delivery start time for a gas day shall be reported as 06:00:00 on Day X, and the delivery end time shall be reported as 06:00:00 on Day X+1. For example, for a gas within-day contract where the delivery starts on 2026-08-01 at 06:00:00, the delivery start date and time should be populated with 2026-08-01 06:00:00. The delivery end date and time should be populated with 2026-08-02 06:00:00.

Example of a yearly baseload product

ContractList

<deliveryStartDateTime>2026-01-01T00:00:00.000+02:00</deliveryStartDateTime>

<deliveryEndDateTime>2027-01-01T00:00:00.000+02:00</deliveryEndDateTime>

<loadType>BL</loadType>

<deliveryProfile>

<loadDeliveryStartDateTime>2026-01-01T00:00:00.000+02:00</loadDeliveryStartDateTime>

<loadDeliveryEndDateTime>2027-01-01T00:00:00.000+02:00</loadDeliveryEndDateTime>

</deliveryProfile>

Example of a monthly peak-load product

ContractList

<deliveryStartDateTime>2026-08-03T00:00:00.000+02:00</deliveryStartDateTime>

<deliveryEndDateTime>2028-09-01T00:00:00.000+02:00</deliveryEndDateTime>

<loadType>PL</loadType>

<deliveryProfile>

<loadDeliveryStartDateTime>2026-08-03T07:00:00.000+02:00</loadDeliveryStartDateTime>

<loadDeliveryEndDateTime>2026-08-01T19:00:00.000+02:00</loadDeliveryEndDateTime>

</deliveryProfile>

<deliveryProfile>

<loadDeliveryStartDateTime>2026-08-04T07:00:00.000+02:00</loadDeliveryStartDateTime>

<loadDeliveryEndDateTime>2026-08-04T19:00:00.000+02:00</loadDeliveryEndDateTime>

</deliveryProfile>

<deliveryProfile>

<loadDeliveryStartDateTime>2026-08-05T07:00:00.000+02:00</loadDeliveryStartDateTime>

<loadDeliveryEndDateTime>2026-08-05T19:00:00.000+02:00</loadDeliveryEndDateTime>

</deliveryProfile>

(The similar pattern is repeated until the end of the delivery month.)

Different price and/or quantity per interval

If a transaction has a load profile with different quantities and/or prices across the relevant time intervals, each distinct delivery interval must be reported separately within the same report. For instance, if the trade or order refers to a five-hour delivery profile, with a different price and quantity per hour, five different delivery intervals will have to be reported within the same report. In such a case Data Fields (85), (86) and (87) shall be populated to indicate the relevant information for the price and/or quantity per interval.

Representation of the load delivery intervals in the electronic format

In the case of reporting the same price and quantity in Data Fields (45) and (53) respectively for each load delivery interval, elements <loadDeliveryStartDateTime> and <loadDeliveryEndDateTime> shall be populated in electronic format. In the case of reporting different a price and/or quantity for each load delivery interval by using Data Fields (85) and (87), fields <intervalStartDateTime> and <intervalEndDateTime> shall be populated.

Representation of the interval in case of a clock change

In case of a long clock change, as there is no unique identification of the traded period, reporting parties shall report the same interval twice. ACER will then consider in chronological order the two intervals reported and thus refer to the third and fourth hour of the day, respectively.

Example of Data Field (84) reported on the long clock change:

00:00/01:00 – first hour

01:00/02:00 – second hour

02:00/03:00 – third hour

02:00/03:00 – fourth hour

Data Field (85) Delivery capacity

No	Field identifier	Description
85	Delivery capacity	The field indicates the number of units included in the transaction, per delivery time interval.

Representation in electronic format		
	quantity	*priceIntervalQuantityDetails* section in the OrderList/TradeList
	<value>	

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of five decimals	Number	20	10

Field description

This field identifies the delivery capacity (i.e. quantity/volume of energy) for each delivery interval if the delivery capacity is different for each delivery interval reported in Data Field (84) Load delivery intervals.

If the delivery capacity is the same for each delivery interval, then this field is not applicable since in such a case the quantity/volume information is to be reported in Data Field (53) Quantity/Volume.

The applicable unit of measurement for the quantity information reported in this field shall be indicated in Data Field (86).

Data Field (86) Quantity unit used in field 85

No	Field identifier	Description
86	Quantity unit used in field 85	The field indicates the unit of measurement used in field 85.

Representation in electronic format		
	quantity	*priceIntervalQuantityDetails* section in the OrderList / TradeList
	<unit>	

Description of accepted values	Type	Length	Examples
KW KWh/h KWh/d MW MWh/h MWh/d GW GWh/h GWh/d Therm/d KTherm/d	Text	2 to 9	MW

MTherm/d			
cm/d			
mcm/d			
tcm/d			
Btu/d			
MMBtu/d			
MJ/d			
100MJ/d			
MMJ/d			
GJ/d			

Field description

This field identifies the unit used for the quantity/volume reported in Data Field (85) Delivery capacity.

The field is mandatory when Data Field (85) is reported with volume information.

Data Field (87) Price/time interval quantity

No	Field identifier	Description
87	Price/time interval quantity	The field indicates the price per quantity per delivery time interval.
Representation in electronic format		
	priceTimeIntervalQuantity	*priceIntervalQuantityDetails* section in the OrderList/TradeList
	<value>	

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxx.yyyyy with a maximum of five decimals	Number	20	50.25

Field description

This field identifies the price for the amount of energy to buy or sell at each time interval if the price differs among the delivery intervals reported in Data Field (84) Load delivery intervals.

If the price is the same for each delivery interval, this field is not applicable, given that the price information shall be reported in Data Field (45) Price in such cases.

The price reported in this field shall be expressed in the price currency indicated in Data Field (49) Price currency and unit.

It is important to note that if several intervals are reported with a different price and/or quantity, in the REMIT report the chronological order (i.e. time sequence) of the interval shall be maintained. This means that it is not allowed to group together several non-consecutive intervals that have the same price and/or quantity.

Example

If Data Field (84) Load delivery intervals indicates two delivery intervals: 9:00 to 12:00 and 12:00 to 15:00 and Data Field (85) Delivery capacity indicates two capacities, for example 10 MW (for delivery 9:00 to 12:00) and 20 MW (for delivery 12:00 to 15:00), then this field shall be used for reporting different prices per unit of energy per each block, for example EUR 50/MWh (for delivery 9:00 to 12:00) and EUR 55/MWh (for delivery 12:00 to 15:00). If the price per unit of energy for the two blocks is the same, then the price should be reported in Data Field (45) Price, and not in this field.

6.8. Data field related to lifecycle information

Data Field (88) Action type

No	Field identifier	Description
88	Action type	When the report refers to: • a transaction reported for the first time, it will be identified as 'new'; • a modification of details of a previously reported transaction, it will be identified as 'modify'; • a cancellation of a wrongly reported transaction, it will be identified as 'error'; • an early termination of an outstanding transaction, it will be identified as 'cancel'.
Representation in electronic format		
	<actionType>	OrderList/TradeList

Description of accepted values	Type	Length	Examples
N = New M = Modify E = Error C = Cancel	Text	1	N

Field description

This field identifies the type of action representing a lifecycle event involving the transaction that is being reported.

The requirements for reporting lifecycle events related to transactions reportable in Table 1 are described in detail in Annex I to the TRUM.

The field is mandatory for all transactions reported in Table 1.

Description of the accepted values

Action type N (new) always indicates the first event in any transaction's lifecycle. This implies that the first order or trade record shall always be reported with Action type N. The following corresponding record with Action type M, C or E can be accepted by ARIS only if a record with Action type N had been successfully reported previously.

Action type M (modify) shall be adopted in case there is a modification of the previously submitted record, which represents a business event (triggered by a business decision or it is a result of a business event).

Action type C (cancel) indicates the last event in the transaction sequence as triggered by a business decision or as a result of a business event, for example when an order from the order book is permanently withdrawn or an outstanding trade is terminated early due to the change in the ACER code of the counterparty (i.e. novation), Action type C shall be reported.

Action type E (error) shall be used if the reporting party needs to indicate that the previously submitted record was erroneously reported, meaning that it was incorrect. Any correction to the already reported information using Action type E will result in a logical deletion (i.e. invalidation) of the corresponding record, which was previously successfully reported. It will, however, not delete the previously reported record from the ARIS database. Reporting an event with Action type E cannot be the result of a business decision, for example to change the economic values, such as price or quantity.

For further information on the application of the different action types, see Annex I to the TRUM.

7. Data fields related to supply contracts to be reported in Table 2

Technical and business requirements for submitting the transaction record

This chapter provides in detail the reporting requirements on the information that the data fields listed in Table 2 of the Annex to the REMIT Implementing Regulation shall be populated with.

It is worth noting that not all the data fields are considered mandatory for all contracts from a business perspective. The data fields are expected to be populated, where applicable, according to the cardinality table and the guidance provided for the individual data fields in this manual. In addition, Annex I and Annex II to the TRUM shall be consulted in parallel with this manual. For the reporting of a bilateral contract in an xml format in Table 2, the REMIT Table 2 electronic format shall be used.

Cardinality table of data fields included in Table 2

M = mandatory
M* = conditionally mandatory
— = not applicable

Field no.	Field name	Non-standard contract
Parties to the contract		
1	ID of the market participant being a counterparty to the contract	M
2	Type of code used in field 1	M
3	ID of the other market participant being the other counterparty to the contract	M
4	Type of code used in field 3	M
5	Reporting entity ID	M
6	Beneficiary ID	M*
7	Type of code used in field 6	M*
8	Trading capacity of the market participant in field 1	M
9	Buy/sell indicator	M
Contract details		
10	Contract ID	M
11	Contract date	M
12	Contract type	M
13	Energy commodity	M
14	Linked transaction ID	M*
15	Type of generation asset	M*
16	Underlying mechanisms	M*
17	Type of Power Purchase Agreement (PPA)	M*
18	Delivery terms	M*
19	Price or price formula	M*
20	Notional amount	M*
21	Notional currency	M*
22	Annual contracted volume	M*

23	Total notional contract quantity	M*
24	Volume optionality capacity	M*
25	Notional quantity unit	M*
26	Volume optionality	M*
27	Volume optionality frequency	M*
28	Volume optionality intervals	M*
Fixing index details

50	Load type	M
Lifecycle information		
51	Action type	M

7.1. Data fields related to parties to the contract

Data Field (1) ID of the market participant being a counterparty to the contract

No	Field identifier	Description
1	ID of the market participant being a counterparty to the contract	The field identifies the market participant by a unique code being a counterparty to the bilateral contract.

Representation in electronic format

<idOfMarketParticipant>

Description of accepted values	Type	Length	Examples
ACER code LEI BIC EIC GLN/GS1 code	Alphanumerical	12 20 11 16 13	A0643278W.EU 1a2b3c4d5e6f7g8e9f0h ACERSILJ500 21X000EUROPEU–8 a1b2c3d4e5f6g

Field description

This field aims to capture the ID of the market participant on whose behalf the bilateral contract is reported.

The field is mandatory for all contracts reported in Table 2.

Definition of a market participant from the reporting perspective

REMIT uses the term market participant, and EMIR uses the term counterparty to identify the reporting party. In the REMIT reporting framework, the term counterparty is considered as the other market participant with whom the reporting market participant identified in field (1) enters a transaction. The other market participant is identified in Data Field (3).

The registration of market participants with the relevant NRA will result in an ACER code. However, if a third party is reporting on behalf of the market participant, the ACER code may not be known. If the ACER code has not been provided by the market participant to the third party reporting on behalf of the market participant, one of the alternative codes listed above shall be used; otherwise, the report will be rejected as invalid.

Market participants are required to register with their relevant NRA. During the registration process, the market participant is required to provide all codes listed as accepted values in Data Field (1), if available. As a result of the registration process, the market participant will be registered in CEREMP and will receive an ACER code.

ACER code of the market participant

For REMIT reporting purposes, the ACER code is the preferred code to be used in the transaction record to identify the market participant, but all the other codes may also be used. If a market participant is already using the LEI for EMIR reporting, that market participant may also use the LEI code for REMIT reporting as long as the LEI has been provided to the NRAs during the registration process.

If a market participant is using an ACER code, its counterparty may use that code to verify the identity of the market participant in the European register of market participants published by ACER and available on the REMIT Portal.

Data Field (2) Type of code used in field 1

No	Field identifier	Description
2	Type of code used in field 1	The field indicates the type of the unique code used in field 1.

Description of accepted values	Type	Length	Examples
ACER code	Text	3	ace
LEI		3	lei
BIC		3	bic
EIC		3	eic
GLN/GS1 code		3	gln

Field description

This field identifies the type of code used in Data Field (1).

For example, if a LEI code is used in the REMIT report to identify the market participant in Data Field (1), the accepted value in Data Field (2) is ‘lei’. If an ACER code is used in Data Field (1), the accepted value is ‘ace’.

Data Field (3) ID of the other market participant being the other counterparty to the contract

No	Field identifier	Description
3	ID of the other market participant being the other counterparty to the contract	The field identifies the other market participant by a unique code being the other counterparty to the bilateral contract.

Representation in electronic format

<otherMarketParticipant>

Description of accepted values	Type	Length	Examples
ACER code	Alphanumeric	12	A0643278W.EU
LEI		20	1a2b3c4d5e6f7g8e9f0h
BIC		11	ACERSILJ500
EIC		16	21X000EUROPEU–8
GLN/GS1 code		13	a1b2c3d4e5f6g

Field description

This field indicates the ID of the other market participant being the other counterparty to the bilateral contract that is reported.

The field is mandatory for all contracts reported in Table 2.

Counterparty without an ACER code

When market participants enter into a bilateral contract reportable in Table 2 and the other market participant (counterparty) to the contract is registered in CEREMP, Data Field (3) shall be populated with one of the codes of that market participant registered in CEREMP. If the other market participant is not registered in CEREMP, the dummy ACER code 'ACERNONMP.EU' should be used in the electronic format in order to indicate that the counterparty is not a registered market participant.

Data Field (4) Type of code used in field 3

No	Field identifier	Description
4	Type of code used in field 3	The field indicates the type of the unique code used in field 3.

Description of accepted values	Type	Length	Examples
ACER code	Text	3	ace
LEI		3	lei
BIC		3	bic
EIC		3	eic
GLN/GS1 code		3	gln

Field description

This field indicates the type of code identifier of the other market participant reported in Data Field (3).

The field is mandatory for all contracts reported in Table 2.

For example, if the LEI code of the market participant is used in Data Field (3), the accepted value in field (4) is 'lei'. If an ACER code is used in Data Field (3), the accepted value in Data Field (4) is 'ace'.

Data Field (5) Reporting entity ID

No	Field identifier	Description
5	Reporting entity ID	The field identifies the RRM by its ACER registration code as the reporting entity of the bilateral contract.

Representation in electronic format
<reportingEntityID>

Description of accepted values	Type	Length	Examples
ACER code	Alphanumeric	12	A0643278W.EU

Field description

This field identifies, by its ACER code, the RRM that submits the report to ACER on behalf of the market participant identified in Data Field (1).

The field is mandatory for all contracts reported in Table 2.

Data Field (6) Beneficiary ID

6	Field identifier	Description
6	Beneficiary ID	The field identifies the beneficiary of the bilateral contract by a unique code, if the beneficiary is not the same as the market participant identified in field 1.

Representation in electronic format

<beneficiaryIdentification>

Description of accepted values	Type	Length	Examples
ACER code LEI BIC EIC GLN/GS1 code	Alphanumeric	12 20 11 16 13	A0643278W.EU 1a2b3c4d5e6f7g8e9f0h ACERSILJ500 21X000EUROPEU–8 a1b2c3d4e5f6g

Field description

This field indicates the ID of the beneficiary of the bilateral contract in case it is executed by another market participant on behalf of a final beneficiary.

The field is always mandatory when the market participant identified in Data Field (1) is not the final beneficiary to the contract. If the beneficiary of the contract is not counterparty to this agreement, the reporting counterparty has to identify the beneficiary by a unique code in this field. In such a case, the trading capacity of the market participant in field 1 shall be identified with ‘A’ for ‘Agent’.

If the beneficiary of the bilateral contract is the market participant identified in Data Field (1), this field is not considered applicable.

For example, if party B is trading on behalf of party C, then party C is the beneficiary, and party B is acting on behalf of party C. As party B enters into a bilateral contract on wholesale energy products, party B is a market participant.

Bilateral contracts with a beneficiary may look like a contract in which market participant A sells to market participant B, with market participant C as the beneficiary. In these cases, ACER will receive one reported non-standard contract: market participant A sells to market participant B, with market participant C identified in Data Field (7) as the beneficiary.

However, a bilateral contract may involve multiple parties. For example, if a bilateral contract is signed between market participant A and market participant B, there may be other trades between (B) and (C) and (D) to represent how they split the value of the trade between (A) and (B).

Data Field (7) Type of code used in field 6

No	Field identifier	Description
7	Type of code used in field 6	The field indicates the type of the unique code used in field 6.

Description of accepted values	Type	Length	Examples
ACER code LEI BIC EIC GLN/GS1 code	Text	3 3 3 3 3	ace lei bic eic gln

Field description

This field identifies the type of code used in Data Field (6).

Data Field (8) Trading capacity of the market participant in field 1

No	Field identifier	Description
8	Trading capacity of the market participant in field 1	The field indicates whether the market participant in field 1 has concluded the bilateral contract as principal or as agent.

Representation in electronic format

<tradingCapacity>

Description of accepted values	Type	Length	Examples
P = Principal A = Agent	Text	1	P

Field description

This field identifies the trading capacity of the market participant identified in Data Field (1).

The field is mandatory for all bilateral contracts reported in Table 2.

If the market participant is acting on its own behalf, this field shall be populated with ‘P’ for ‘Principal’.

If the market participant is acting on behalf of a third party as an agent, this field shall be populated with ‘A’ for ‘Agent’, and the beneficiary identification needs to be reported in Data Field (6).

Data Field (9) Buy/sell indicator

No	Field identifier	Description
9	Buy/sell indicator	The field indicates whether the bilateral contract was concluded on the buy or sell side (or in certain scenarios both) by the market participant identified in field 1.

Representation in electronic format

<buySellIndicator>

Description of accepted values	Type	Length	Examples
B = Buy S = Sell C = Buy and Sell	Text	1	B

Field description

The buy/sell indicator indicates whether the market participant is reporting the non-standard contract for the buying or selling of the commodity. 'B' shall be indicated for 'buy' and 'S' shall be indicated for 'sell' from the perspective of the reporting market participant, or from the perspective of the client in the case of an agent transaction (e.g. involving an executing broker).

The field is mandatory for all contracts reported in Table 2.

Reporting the buy/sell indicator in the case of derivatives

For derivatives that have not been reported under EMIR, and are therefore reported under REMIT, the following logic should apply for the reporting of this data field: for example, in the case of a fixed-to-floating derivative, if market participant A buys a swap, then market participant A pays a fixed price and market participant B pays a floating price. This means that market participant A receives the floating leg and market participant B receives the fixed leg. In the case of a floating-to-floating derivative, if market participant A buys a swap, market participant A pays the floating price of the first leg (or index) and market participant B pays the floating price of the second leg (or second index). In this case, the two legs (indices) of the swap should be sorted alphabetically.

If market participant A and market participant B enter into a swap agreement in which the financial settlement is the difference between two floating indices, 'XYZ index' and 'ABC index', market participant A is the buyer of the swap if it pays the floating price of ABC index and receives the floating price of XYZ index, while market participant B is the seller of the swap, as it receives the floating price of ABC index and pays the floating price of XYZ index.

Purchase-seller agreements

In ACER's view, purchase-seller agreements are considered as non-standard contracts with undefined price and/or quantity; hence, they are reported in Table 2. Such a bilateral contract should be reported either as one contract, with 'C' indicated for the buy/sell indicator in Data Field (10), or as two separate contracts, one reported as 'B' for 'buy' and the other as 'S' for 'sell', provided the meaning of the two reports is the same. Any resulting execution concluded under the framework of the Table 2 non-standard contract should be reported in Table 1.

7.2. Data fields related to contract details

Data Field (10) Contract ID

No	Field identifier	Description
10	Contract ID	The field identifies the bilateral contract by using a unique code identifier as assigned by the counterparties to the contract.

Representation in electronic format

<contractId>

Description of accepted values	Type	Length	Examples
Up to 100 alphanumerical digits	Alphanumeric	100	AGHDN15832839

Field description

This field identifies the unique contract ID as assigned by the two market participants being counterparties to the contract to be reported. The contract ID must be the same for the two sides (buy and sell) of the contract and shall remain unique throughout the lifecycle of the contract.

The field is mandatory for all contracts reported in Table 2.

Data Field (11) Contract date

No	Field identifier	Description
11	Contract date	The field indicates the date when the bilateral contract was concluded, modified or cancelled, as agreed by the counterparties.

Representation in electronic format

<contractDate>

Description of accepted values	Type	Length	Examples
ISO 8601 date and time format using UTC	Date and time	n/a	2026-07-29T16:30:00Z

Field description

This field identifies the date at which the bilateral contract was agreed between the counterparties. The field must reflect the actual date as a string representation of the ISO 8601 date and time format.

The reportable date of the contract is the date of the first binding agreement.

The field is mandatory for all contracts reported in Table 2.

Data Field (12) Contract type

No	Field identifier	Description
12	Contract type	The field indicates the type of the contract.

Representation in electronic format

<contractType>

Description of accepted values	Type	Length	Examples
FW = Forward style contract OP = Option style contract OP_FW = Option on a forward OP_FU = Option on a future OP_SW = Option on a swap SP = Spread SW = Swap OT = Other **Applicable to PPAs:** SO_PPA = Spot contract concluded under a PPA FW_PPA = Forward contract concluded under a PPA FU_PPA = Future contract concluded under a PPA OP_PPA = Option contract concluded under a PPA SP_PPA = Spread contract concluded under a PPA SW_PPA = Swap contract concluded under a PPA	Text	5	FW

Field description

This field identifies the type of contract that is reported in Table 2 as a non-standard contract.

For bilateral contracts, a forward-style contract refers to the forward style, which also includes spot contracts. Market participants should not understand forward style as a sort of derivative contract, but rather as the style of the contract itself, i.e. for physical delivery at a later date.

'OT' means that ACER expects reporting parties to use the value 'other' only in exceptional cases and to notify ACER in a timely manner via the REMIT Query Form in case none of the accepted values listed above are applicable to the type of transaction or contract that they intend to report.

The field is mandatory for all contracts reported in Table 2.

Reporting non-standard contracts related to spreads

When trading a spread under the framework of a Table 2 non-standard contract, Data Field (12) is expected to be populated with 'SP' for 'Spread' for both legs (e.g. for the electricity leg and for the gas leg in the case of a spark spread). In the case of execution, the Table 1 report should indicate the contract type of the underlying contracts, for example 'FW' in the case of forward-style contracts.

Data Field (13) Energy commodity

No	Field identifier	Description
13	Energy commodity	The field indicates the energy commodity subject to the bilateral contract.

Representation in electronic format

<energyCommodity>

Description of accepted values	Type	Length	Examples
EL = Electricity NG = Gas LG = Liquified natural gas	Text	2	NG

Field description

This field identifies the energy commodity of the product delivered: natural gas, liquefied natural gas or electricity. Other commodities, such as emissions rights, coal, oil, etc., are out of the scope of REMIT.

Spreads are not considered commodities. Clean and dirty spark spreads – trades that involve both electricity and gas – have to be reported separately, unless the contract itself includes both commodities, in which case both gas and electricity should be reported in this field.

Such clean and dirty dark spreads that involve electricity, coal and emissions should be reported as an electricity contract. Contracts related to coal and emissions are not considered wholesale energy products and are thus not reportable under REMIT.

The field is mandatory for all contracts reported in Table 2.

Data Field (14) Linked transaction ID

No	Field identifier	Description
14	Linked transaction ID	The field identifies the linked transaction by using a unique identifier that is associated to the reported bilateral contract.

Representation in electronic format

<linkedTransactionID>

Description of accepted values	Type	Length	Examples
Up to 100 alphanumerical digits	Alphanumeric	100	1234567890abcdefrgf

Field description

This field shall indicate if two or more bilateral contracts and/or transactions are linked to each other due to a specific contractual arrangement or business agreement. In such cases, the contract ID of the

related non-standard contract already reported in Data Field (10) in Table 2 or the UTI of the bilateral trade reported in Data Field (38) in Table 1 shall be populated in this field.

The linked transaction ID is considered applicable in the following (non-exhaustive) list of scenarios.

1. When bilateral contracts belong to the same option, spread or swap trading strategy (e.g. butterfly, condor), the contract ID or the UTI of the related bilateral contract or trade shall be reported in this field.

2. When two or more contracts are contractually bundled into a single corporate PPA, the two contracts should be linked to each other via this field. For example, corporate PPAs may be constructed in a sleeved structure where one party acts as an intermediary between the generator and the final buyer. In this case, each leg of the bundled contract shall be reported separately and linked via the linked transaction ID to reflect their contractual relationship.

3. If a purchase-seller agreement is reported as two separate non-standard contracts in Table 2 (i.e. one for the buy leg and one for the sell leg), the contract ID of the other leg shall be reported in this field.

Data Field (15) Type of generation asset

No	Field identifier	Description
15	Type of generation asset	The field indicates the underlying asset(s) providing the energy, when applicable.

Representation in electronic format

<genAssetType>

Description of accepted values	Type	Length	Examples
SLR = Solar HDR = Hydro ONW = Onshore Wind OFW = Offshore Wind BIM = Biomass NUC = Nuclear NAG = Natural gas COL = Coal OIL = Oil PFL = Portfolio HRE = Hybrid Renewable	Text	3	SLR

Field description

This field is applicable to PPAs to identify the underlying generation asset that is responsible for producing the energy to be delivered.

The field is mandatory when the contract type reported in Data Field (12) refers to a PPA featuring the reported non-standard contract.

Description of accepted values

When the generation of the energy is carried out by a single asset type, one of the following values shall be reported: solar, hydro, onshore wind, offshore wind, biomass or nuclear. Fossil-fuelled assets are split into natural gas, oil and coal.

Asset type 'PFL' for 'Portfolio' is expected to be reported in case the PPA aggregates the output of multiple generation assets of different types, which may include both renewable (e.g. solar, hydro, onshore wind, offshore wind, biomass) and non-renewable sources (i.e. nuclear or fossil).

Asset type 'HRE' for 'Hybrid renewables' shall be indicated if the PPA is linked to a renewable generation asset combined with an energy storage component (e.g. solar and battery, or wind and battery), where the energy input is derived exclusively from renewable sources.

If the reportable PPA is not linked to a specific generation asset, this field is not applicable.

Data Field (16) Underlying mechanisms

No	Field identifier	Description
16	Underlying mechanisms	The field indicates the mechanism contributing to the conclusion of the bilateral contract, such as subsidy scheme, release or guarantees of origin.

Representation in electronic format

<contractUnder>

Description of accepted values	Type	Length	Examples
SUB = Subsidy REL = Release GOO = Guarantees of origin	Text	3	Subsidy

Field description

This field shall identify the mechanisms or schemes impacting the formation of the contract. The field is considered particularly applicable to PPAs that may benefit from specific regulatory, financial or certification schemes. Nevertheless, the field may be applied to other non-standard contracts as well.

The field is mandatory when the contract type reported in Data Field (12) refers to a PPA featuring the reported non-standard contract in case there is an underlying mechanism in place.

Description of accepted values

When reporting a PPA in Table 2, one of the following mechanism/schemes are expected to be flagged in the report, if applicable:

- subsidy schemes ('SUB') (e.g. market premia, contracts for differences, capacity mechanisms, state-backed guarantees);
- release programmes ('REL') (e.g. gas release programmes, regulated capacity auctions);
- guarantees of origin ('GOO') (certification of energy origin).

When reporting the price formula for non-standard contracts involving guarantees of origin, the reported formula in Data Field (19) is not expected to have a reference to guarantees of origin as long as they are not factored into the pricing formulation of the energy.

In case more than one underlying mechanism is applicable to the reported PPA, all mechanisms shall be indicated in this field, facilitated by the repeatable field in the schema.

Example

If a wind farm has a PPA supported by a feed-in tariff, this field should indicate 'SUB' to reflect that the contract was concluded under a subsidy scheme. If the agreement is also backed by guarantees of origin, value 'GOO' is also expected to be reported.

Data Field (17) Type of Power Purchase Agreement (PPA)

No.	Field Identifier	Description
17	Type of Power Purchase Agreement (PPA)	The field indicates whether the bilateral contract refers to a baseload, pay as produced, pay as forecasted, fixed hourly profile, a dynamic PPA, as defined in Article 2, point (77), of Regulation (EU) 2019/943, or other.

Representation in electronic format

<PPAType>

Description of accepted values	Type	Length	Examples
BL = Baseload PP = Pay as produced PF = Pay as forecasted PN = Pay as nominated PC = Pay as consumed FH = Fixed hourly profile DP = Dynamic PPA OT = Other	Text	2	BL

Field description

This field identifies the contractual structure of a PPA by specifying how the electricity delivery and the related payments are structured.

The field is mandatory when the contract type reported in Data Field (12) refers to a PPA featuring the reported non-standard contract. If several types apply to the reported contract, all relevant values shall be indicated facilitated by the repeatable field in the schema.

Description of accepted values

BL = Baseload. The buyer receives a constant, predetermined volume of electricity over the contract period.

PP = Pay as produced. The buyer receives all electricity generated by the asset, with volume varying based on real-time production.

PF = Pay as forecasted. The buyer receives electricity based on a forecasted production schedule, with potential adjustments if actual generation differs.

PC = Pay as consumed. The buyer pays for the electricity based on their metered consumption.

PN = Pay as nominated. The buyer receives the electricity based on the pre-agreed nominations.

FH = Fixed hourly profile. The contract specifies a predefined delivery profile with fixed hourly quantities.

DP = Dynamic PPA. The delivery profile adjusts based on market signals, demand, or price triggers.

OT = Other. ACER expects reporting parties to use the value 'Other' only in exceptional cases and to notify ACER in a timely manner via the REMIT Query Form in case none of the accepted values listed above are applicable to the type of transaction or contract that they intend to report.

Data Field (18) Delivery terms

No	Field identifier	Description
18	Delivery terms	The field indicates the terms of the delivery as specified in the bilateral contract.

Representation in electronic format

<deliveryTerms>

Description of accepted values	Type	Length	Examples
DES FOB OTH	Text	3	DES

Field description

This field is applicable to contracts for the supply of LNG (typically LNG portfolio-type contracts, as described in Section 2.2.3) and shall identify the terms of the delivery, as specified in the contract, by referring to the respective industry standard, such as Incoterms (International Commercial Terms). In ACER's understanding, supply contracts for the purchase or sale of LNG have delivery terms typically specified as either 'delivery ex-ship' or 'free on board'.

Executions related to LNG portfolio-type contracts reported in Table 2 are considered reportable as LNG market data. For further information on the reporting requirements of LNG market data, see Annex III to the TRUM.

The field is mandatory when Data Field (13) Energy commodity is populated with 'LG'.

Description of accepted values

DES = Delivery ex-ship ([22]). The seller is responsible for the LNG until it is delivered to a specified port. After delivery, all obligations shift to the buyer. The delivery point is specified in the contract.

([22]) DES is commonly encountered in LNG contracts, but it is no longer an official Incoterms rule.

FOB = Free on board. The buyer acquires the LNG and is responsible for shipping. The delivery point may not be specified in the original contract. Both spot- and portfolio-type contracts can be agreed on an FOB basis.

OTH = Other. On rare occasions, the value 'OTH' may be used, for example when the delivery terms specified in the contract are different from DES or FOB.

Data Field (19) Price or price formula

No	Field identifier	Description
19	Price or price formula	The field indicates the fixed price or price formula used in the bilateral contract. The field shall include references to all indices included in the formula.

Representation in electronic format

<priceOrPriceFormula>

Description of accepted values	Type	Length	Examples
For price: Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of five decimals. **For formula:** Up to 1 500 alphanumerical digits.	Number Alphanumeric	20 1000	35.00 HGSG/HBS*+578HSH

Field description

This field identifies the agreed price per unit of energy, as indicated in Data Field (25). In the case of options, this field represents the premium. If the contract includes a price formula, the formula shall be reported in this field.

ACER acknowledges that a price formula may be very complex and may not be represented in the same way in the systems of the two counterparties to the contract. In the case of complex price formulas, market participants should report a simplified version of each formula, provided that clear references **to all indices** forming part of the formula are included and the fixed and variable components are specified. All relevant indices shall be reported in Data Field (30) Fixing index. In the case of a floating index value, the reporting parties shall refer to the period of time and the algorithm that is considered to set the actual price.

ACER acknowledges that a price formula may be very complex and may not be represented in the same way in the systems of the two counterparties to the contract. In case of complex price formulas, market participants should report a simplified version of the formula, provided a clear reference **to all indices** being part of the formula is reported by specifying the fixed and variable components. All relevant indices shall be reported in Data Field (30) Fixing index.

The following summary table presents the general indications on the expected way of reporting a formula.

Indication	Current examples reported	Expected way of reporting
Defining constants directly in the formula	P0 + index name DA; P0 = 0.5	[Name of the index_DA] + 0.5 €/MWh
Avoiding repetitions	1 * Index Index + –1	Index Index –1
Keeping the text strictly to the formula	'Price = index + 1 €/MWh' 'Formula index + 1 €/MWh' 'Proxy 100 % of index'	'Index + 1 €/MWh' 'Index + 1 €/MWh' 'Index'
Including the unit of measurement inside the formula for clarity	[Name of the index_DA] + 3	[Name of the index_DA] + 3 €/MWh
Reporting the exact name of the index	Index – premium	[Name of the index_DA] + 1 €/MWh
Avoiding indicating undefined functions	0.5 * CustomFunction (0, Index 1, Index 2)	[Explanation of the function's calculations is expected]
Reporting in English language	—	0.9 × day-ahead market price (exchange X) + 2.5 €/MWh
Using numeric standard as defined in the electronic format	20,123456	20.12346

Additional examples

1. Two market participants conclude a purchase obligation/feed-in tariffs contract with a capacity above 10 MW, i.e. regulated contracts for the physical delivery of electricity by a single production unit with a capacity greater than 10 MW or by production units with a combined capacity greater than 10 MW. In the example, the price is fixed by the provision of the relevant NRA related to the contract date.

   Example of a concise representation of the formula reported in this field:

   - provision NRAXX n.xxx/YYYY for offshore wind-based production;
   - 13 c€/kWh in the first 10 years;
   - 3 < price < 13 c€/kWh for the last five years.

2. Two market participants conclude a contract on an option for the same capacity (50 % – 50 % in volume) on the same underlying product traded at 48 EUR/MWh (the only price displayed is the forward price minus the premium, for a strike price of 47 EUR/MWh). The contract includes a clause for partial delivery meaning that the buyer has the right to take delivery for all or part of the volume. The hourly volume is requested at least two days before delivery. The charge due by the buyer is reduced by 98 % of the amount of the valuation by time period of energy not supplied on the actual day (D-Day) at the price of OMP X hourly fixing of D-Day in the case of positive prices. In the case of negative prices, the charge due by the buyer is reduced by 102 % of the amount of the valuation by time period of energy not supplied on the actual day (D-Day) at the price of the OMP X hourly fixing of D-Day.

   Example of a concise representation of the formula with conditions embedded:

   - *if OMP X DA > 0, then (48 × energy volume – 0.98 × OMP X country A day-ahead auction hour × not delivered energy volume) / energy volume*;
   - *else (48 × 10 – 1.02 × OMP X country A day-ahead auction hour × not delivered energy volume) / 10*.

3. The formula is comprised on an index ± premium and all the other reporting conditions of Table 1 are met (e.g. a fixed volume and a fixed delivery profile). Such bilateral trade should be reported in Table 1.

   Example of a concise representation of the formula of a deviation from an index (with only one index and spread):

   - *[name of the index] + 0.1 €/MWh*.

4. Example of a concise representation of a formula defined for a period with a start date and an end date:
   - 01/01/2026 – 31/03/2026: *[name of the index] + 0.1 €/MWh*;
   - 01/04/2026 – 30/06/2026: *[name of the index] + 0.5 €/MWh*.

5. Example of a concise representation of a formula that varies depending on the marketplace where the transaction occurs:

   - bilateral: *[OTC 2023] / 5 + 0.1 €/MWh*;
   - exchange X: *[exchange X THE 2023] / 5 + 0.15 €/MWh*.

6. Example of a concise representation of a formula combining multiple conditions and time periods:

   - 01/01/2026 – 31/03/2026: *if [name of the index] > 30 €, then [name of the index] – 2 €; else 30 €*;
   - 01/04/2026 – 30/06/2026: *if [name of the index] > 35 €, then [name of the index] – 4 €; else 35 €*.

Data Field (20) Notional amount

No	Field identifier	Description
20	Notional amount	The field indicates the notional amount of the bilateral contract. If the calculation is subject to variables, an estimation shall be provided.

Representation in electronic format

<notionalAmount>

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxx.yyyyy with a maximum of five decimals	Number	20	53450.00

Field description

This field identifies the notional amount of the contract. ACER understands that, in most of the cases, non-standard contracts reported in Table 2 entail features of volume and/or price flexibility and optionality, meaning that the contract is reported without a fixed price and/or quantity. In such cases, market participants shall provide an estimation (without further lifecycle reporting requirements) for the notional amount in this field, based on the best available information at the time of reporting.

The notional amount should be calculated using the following formula:

Notional amount = price × total notional contract quantity, where:

- 'price' is defined as the price of the volume as per Data Field (19);
- 'total notional contract quantity' is the quantity of energy as per Data Field (23).

For example, a contract traded for a price of 50 EUR/MWh for a volume of 100 MW delivered for 8 hours has the following notional amount:

50 EUR/MWh × 100 MW × 8 h = EUR 40 000

or, for a monthly contract:

50 EUR/MWh × 100 MW × 8 h/day × 30 days = EUR 1 200 000

For the calculation of the notional amount for options, the price reported in Data Field (45) Option strike price should be used, and not the option premium.

Data Field (21) Notional currency

No	Field identifier	Description
21	Notional currency	The field indicates the currency of the notional amount in field 20.

Representation in electronic format

<notionalAmount>

Description of accepted values	Type	Length	Examples

ISO 4217 currency codes and additional accepted values with three alphabetical digits: CHF = Swiss franc CZK = Czech koruna DKK = Danish krone EUR = Euro GBP = Pound sterling HUF = Hungarian forint ISK = Icelandic króna NOK = Norwegian krone PLN = Polish zloty RON = Romanian leu SEK = Swedish krona USD = US dollar TRY = Turkish lira	Text	3	EUR

Field description

This field identifies the currency for the value indicated in Data Field (19) Price or price formula and/or Data Field (20) Notional amount.

Data Field (22) Annual contracted volume

No	Field identifier	Description
22	Annual contracted volume	The field indicates the annual contracted volume as agreed by the counterparties to the bilateral contract.

Representation in electronic format
annualContractedVolume section
<reportedYear>
<unit>

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxx.yyyyy with a maximum of five decimals	Number	20	1000

Field description

This field shall be populated with the annual contracted volume, as agreed between the counterparties, representing the total amount of energy to be delivered in the next calendar year under the framework of the bilateral contract already reported in Table 2.

In ACER's understanding, annual contracted volumes are typically agreed as part of the annual delivery programmes related to LNG portfolio-type contracts (as described in Section 2.2.3), that are setting the total amount of LNG to be executed (delivered) in the following gas year.

Lifecycle reporting requirement

If applicable, the annual contracted volume reported in this field is expected to be updated **each gas year** with the agreed volume as a lifecycle event to the bilateral contract by using Action type M. When reporting the modification, Data Field (11) Contract date shall indicate the date of the agreement on the annual contracted volume. In addition, the dedicated schema field <reportedYear> shall be populated with the calendar year the annual contracted volume refers to.

If the terms of the reported bilateral contract do not specify any future annual contracted volumes to be agreed upon as part of the delivery schedule, the field is not applicable.

Data Field (23) Total notional contract quantity

No	Field identifier	Description
23	Total notional contract quantity	The field indicates the total number of units of the wholesale energy product. If the calculation is subject to variables, an estimation shall be provided.

Representation in electronic format
<totalNotionalContractQuantity>

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxx.yyyyy with a maximum of five decimals	Number	20	1000

Field description

This field identifies the total quantity or energy volume of the contract (total notional contract quantity). Total notional contract quantity should be calculated via using the maximum defined capacity in the contract. The notional contract quantity should be calculated by using the following formula:

Total notional contract quantity = volume × number of periods, where:

- 'volume' is the quantity of energy as per Data Field (24) Volume optionality capacity (if available);
- 'number of periods' is the number of times that quantity is delivered or received as per Data Field (49).

For example, a contract traded for a volume of 100 MW delivered for 8 hours would have the following total notional contract quantity:

100 MW × 8 h = 800 MWh

or, for a monthly contract:

100 MW × 8 h × 30 days = 240 000 MWh

In case the above mentioned two elements of the formula are defined/known by the contract (especially if the volume classification of the capacity is indicated as 'F' for 'fix' in Data Field (26) Volume

optionality), market participants are expected to perform the calculation of the TNCQ of the contract and report it in Data Field (23).

ACER understands that without a defined quantity, market participants will be only able to provide an estimated notional contract quantity, for example in cases where the volume optionality is indicated as 'min/max' in Data Field (26).

Where the total notional contract quantity is not fixed, an estimation shall be provided in this field (without further lifecycle reporting requirements). This scenario may be applicable mainly when the volume optionality is indicated as 'complex' or 'variable' in Data Field (26).

Data Field (24) Volume optionality capacity

No	Field identifier	Description
24	Volume optionality capacity	The field indicates the number of units included in the bilateral contract per delivery time interval, if available.

Representation in electronic format

<volumeOptionalityIntervals>

Description of accepted values	Type	Length	Examples
Up to 20 alphanumerical digits	Alphanumeric	20	100/200

Field description

This field identifies the number of units included in the contract per delivery time interval, if available.

For example, if the non-standard contract has optionality relating to the capacity per time interval, this should be reported in this field. Please see the examples available in Annex II.

Data Field (25) Notional quantity unit

No	Field identifier	Description
25	Notional quantity unit	The field indicates the unit of measurement used in fields 22, 23 and 24.

Representation in electronic format

<unit>

Description of accepted values	Type	Length	Examples
For fields 22 and 23: KWh MWh GWh Therm kTherm	Text	2 to 8	MWh

MTherm
cm
mcm
Btu
MMBtu
MJ
MMJ
100MJ
GJ

For field 24:
KW
KWh/h
KWh/d
MW
MWh/h
MWh/d
GW
GWh/h
GWh/d
Therm/d
KTherm/d
MTherm/d
cm/d
mcm/d
Btu/d
MMBtu/d
MJ/d
100MJ/d
MMJ/d
GJ/d

Field description

This field must identify the units used for the reported quantity in Data Field (22) Annual contracted volume, Data Field (23) Total notional contract quantity and Data Field (24) Volume optionality capacity.

Where the units for Data Fields (22), (23) and (24) differ, the different quantity units should be provided accordingly.

Data Field (26) Volume optionality

No	Field identifier	Description

26	Volume optionality	The field indicates the volume classification.

Representation in electronic format
<volumeOptionality>

Description of accepted values	Type	Length	Examples
V = Variable F = Fixed M = Min/Max C = Complex O = Other	Text	1	F

Field description

This field identifies the type of volume classification of the capacity indicated in Data Field (24). This is a representation of the flexibility of the contract capacity.

For example, it refers to the volume classification, such as variable ('V') (e.g. unbound variable capacity), fixed ('F') (e.g. 100), min/max ('M') (e.g. 100 to 200), complex ('C') (e.g. 0 [zero] or 100 to 200) or other ('O') (e.g. 0 or 200). For trading examples, see Annex II to the TRUM.

ACER understands that without a fixed price and/or quantity, market participants will only be able to provide an estimated notional amount. In such cases, an estimation is required and must be provided based on the best available information at the time of reporting.

'C' for 'Complex' should generally cover all cases where the volume optionality cannot be classified as one of the non-complex options (i.e. variable, fixed or min/max).

When this field is populated with 'V', 'M', 'C' or 'O', the applicable value is expected to be provided in this field.

Data Field (27) Volume optionality frequency

No	Field identifier	Description
27	Volume optionality frequency	The field indicates the frequency of the volume optionality, such as daily, weekly, monthly, seasonal, annual or other.

Representation in electronic format
<volumeOptionalityFrequency>

Description of accepted values	Type	Length	Examples
X = Half hourly H = Hourly D = Daily	Text	1	Q

W = Weekly M = Monthly Q = Quarterly S = Seasonal A = Annual O = Other			

Field description

This field identifies the frequency of the volume optionality, as indicated in Data Field (26). This is a representation of how frequently the capacity of the non-standard contract can be 'flexed'.

For example, it refers to the hourly, daily, weekly, monthly, seasonal, annual or other volume optionality frequency, as specified in the table above. It does not specify the exact dates and times when the contract capacity can be changed, but only the frequency at which the capacity can be adjusted.

Data Field (28) Volume optionality intervals

No	Field identifier	Description
28	Volume optionality intervals	The field indicates the time interval for each volume optionality.

Representation in electronic format
<volumeOptionalityIntervals>

Description of accepted values	Type	Length	Examples
ISO 8601 date format	Date	n/a	2026-01-01 / 2026-03-31

Field description

This field identifies the time interval for each volume optionality, as indicated in Data Field (24), during which the market participant of the non-standard contract can adjust the volume capacity.

The field is represented by the <startDate> and <endDate> fields in the schema. If, for some reason, the <startDate> and <endDate> are not applicable (i.e. their values are not known), a dummy value '1900-01-01' should be used for both fields to indicate that no volume optionality intervals are available.

Whenever Data Field (24) Volume optionality capacity must be reported, this field becomes mandatory and both Data Field (24) and Data Field (28) have to be reported within the <volumeOptionalityIntervals> element in the schema.

7.3. Data fields related to fixing index details

Data Field (29) Type of index price

No	Field identifier	Description

29	Type of index price	The field indicates the price classified as fixed, simple index (single underlying) or complex price formula (multiple underlying).

Representation in electronic format
<typeOfIndexPrice>

Description of accepted values	Type	Length	Examples
F = Fixed I = Simple Index C = Complex Price Formula O = Other	Text	1	C

Field description

This field identifies the type of index or reference price indicated in Data Field (30) and used to set the price of the contract. Some contracts, both derivative and non-derivative, related to the delivery of gas or electricity, are traded on the basis that the price will be fixed by an index value or reference price upon its publication.

The price can be classified as:

- F = fixed; applicable when the contract has a fixed price;
- I = simple index; applicable when the price is set by a simple index (e.g. a single underlying);
- C = complex price formula; applicable when the price is set by multiple underlyings used in a formula.

The value ‘other’ may be used only in exceptional cases in which none of the above applies. In the case of ‘other’, market participants are expected to contact ACER for further guidance in order to select the appropriate type.

Data Field (30) Fixing index

No	Field identifier	Description
30	Fixing index	The field indicates the list of indices determining the price in the bilateral contract. For each index the name shall be specified. In case of a basket of indices for which no unique identifier exists, the basket or the index shall be indicated.

Representation in electronic format
<fixingIndex>

Description of accepted values	Type	Length	Examples
Up to 150 alphanumerical digits	Alphanumeric	150	EUGAS day-ahead publisher name

Field description

This field identifies the name of the fixing index used to set the price of the transactions executed under the bilateral contract. Market participants shall report the name of the fixing index in this field. Where the contract has several fixing indices, each of them should be reported in this field.

The source of the fixing index or indices reported in this field shall be indicated in Data field (32) Fixing index sources.

Market participants shall report the name of the index as advertised by the publisher.

If the index is not public, market participants should make best efforts to minimise any discrepancy with the other market participant when reporting this information.

Further guidance on how to report bilaterally agreed index trades in Table 1 and Table 2 is available under Data Field (27) Fixing index or reference price in Table 1.

Only indices related to an energy commodity should be reported in this field. This would also include oil and coal, or any other energy commodity to fix the price of gas or electricity. This implies that there is no need to report foreign-exchange reference in the fixing index details section of Table 2. If, for any reason, market participants want to report foreign-exchange reference, it can be reported in the formula under Data Field (19) Price or price formula.

Data Field (31) Fixing index types

No	Field identifier	Description
31	Fixing index types	The field indicates the fixing index type such as spot, forward, swap, spread or other.

Representation in electronic format

<fixingIndexType>

Description of accepted values	Type	Length	Examples
SO = Spot FW = Forward style contract FU = Future style contract OP = Option style contract OP_FW = Option on a forward OP_FU = Option on a future OP_SW = Option on a swap SP = Spread SW = Swap OT = Other	Text	Up to 5	FW

Field description

This field identifies the type of fixing index indicated in Data Field (30) and used in the bilateral contract that is being reported. Where the contract has several types of fixing indices, each of them should be reported in this field.

For example, if the index is a spot price published by an exchange, the value ‘SO’ shall be reported. If the index is published by a price-reporting agency or other publisher and it represents the delivery of

the energy commodity during a specific day, week, weekend, month, etc., the value 'FW' shall be reported. If the index is a future price published by an exchange, the value 'FU' shall be reported.

In the case of 'other', market participants are expected to contact ACER for further guidance in order to select the appropriate index type.

Data Field (32) Fixing index sources

No	Field identifier	Description
32	Fixing index sources	The field indicates for each index the publication source. In case of basket of indices for which no unique identifier exists, the basket or the index shall be indicated.

Representation in electronic format

<fixingIndexSource>

Description of accepted values	Type	Length	Examples
Up to 150 alphanumerical digits	Alphanumeric	100	Index source name

Field description

This field identifies the source of the fixing index or indices reported in Data Field (30) Fixing index. Where the bilateral contracts have several sources for the fixing indices, each source should be reported in this field.

For each index reported in Data Field (30), market participants shall specify the publication source of the index. In the case of a basket of indices for which no unique publisher exists, market participants shall report all sources of the basket of indices.

For example, if the index 'EU-GAS-CALENDAR-YEAR-2015-PUB-NAME' is reported in Data Field (30), market participants shall report the source of the index publication, for example 'EU-GAS-PRICES-PUB-NAME', and the publisher's name, for example 'PUB-NAME', needed to identify where the index is published. This applies to each individual index reported in Data Field (31).

If the indices 'EU-GAS-CALENDAR-YEAR-2015-PUB-NAME-ABC' and 'EU-GAS-CALENDAR-YEAR-2015-PUB-NAME-123' are reported in Data Field (30), market participants shall report the source of the publication for both, for example 'PUB-NAME-ABC' and PUB-NAME-123'.

Data Field (33) First fixing date

No	Field identifier	Description
33	First fixing date	The field indicates the first fixing date determined by the earliest date of all the fixings.

Representation in electronic format

<firstFixingDate>

Description of accepted values	Type	Length	Examples
ISO 8601 date format	Date	n/a	2026-01-29

Field description

This field identifies the first date at which the price of the bilateral contracts can be set using the index indicated in Data Field (30) Fixing index.

If the bilateral contract has several indices and each of them may be used to set the price of the contract or the executions, market participants shall report the first date at which the price can be fixed for each index reported in Data Field (30).

For example:
1. the index ABC may be used to fix the price from 2026-01-01 to 2027-12-31;
2. the index 123 may be used to fix the price from 2026-08-01 to 2028-03-31; and
3. the index XYZ may be used to fix the price from 2026-12-01 to 2029-03-31.

In this case, market participants shall report '2026-01-01', '2026-08-01' and '2026-12-01' in this field.

Data Field (34) Last fixing date

No	Field identifier	Description
34	Last fixing date	The field indicates the last fixing date determined by the latest date of all the fixings.

Representation in electronic format
<lastFixingDate>

Description of accepted values	Type	Length	Examples
ISO 8601 date format	Date	n/a	2034-01-29

Field description

This field identifies the last date at which the price of the contract can be fixed using the index indicated in Data Field (30) Fixing index.

If the contract has several indices and each of them may be used to set the price of the contract or the executions, market participants shall report the last date at which the price can be fixed for each index reported in Data Field (30).

For example:
1. the index ABC may be used to fix the price from 2026-01-01 to 2027-12-31;
2. the index 123 may be used to fix the price from 2026-04-01 to 2028-03-31; and
3. the index XYZ may be used to fix the price from 2026-04-01 to 2029-03-31.

In this case, '2027-12-31', '2028-03-31' and '2029-03-31' shall be reported in this field.

If the last fixing date is equal to Data Field (33) First fixing date, the field should not be reported.

Data Field (35) Fixing frequency

No	Field identifier	Description
35	Fixing frequency	The field indicates the fixing frequency, such as daily, weekly, monthly, seasonal, annual or other.

Representation in electronic format

<fixingFrequency>

Description of accepted values	Type	Length	Examples
X = Half hourly H = Hourly D = Daily W = Weekly M = Monthly Q = Quarterly S = Seasonal A = Annual O = Other	Text	1	W

Field description

This field identifies the frequency of the fixing of the index reported in Data Field (30).

For example, it refers to the daily, weekly, monthly, seasonal, annual or other frequency, as specified in the table above. The information reported in this field does not specify the exact dates and times when the fixing occurs, but only its frequency.

The price of the contract or the executions can be set on the basis of an index that is used daily or monthly.

In the case of 'other', market participants are expected to contact ACER for further guidance in order to select the appropriate frequency type.

Data Field (36) Settlement method

No	Field identifier	Description
36	Settlement method	The field indicates whether the bilateral contract is settled physically or in cash, and whether the parties had an option over the settlement method.

Representation in electronic format

<settlementMethod>

Description of accepted values	Type	Length	Examples

P = Physically settled without optionality	Text	1	P
C = Cash settled without optionality		1	
P_OP = Physically settled with optionality		4	
C_OP = Cash settled with optionality		4	

Field description

This field identifies the type of settlement for the bilateral contract.

The majority of bilateral contracts traded under REMIT are for physical delivery, but there may also be derivative contracts that are not reported under EMIR and are thus reported under REMIT. Consequently, different types of settlement methods may apply. For bilateral contracts, such as options on futures or swaps, which settle into the underlying future or swap, the settlement method should be considered to be physical delivery of the underlying contract, and the value 'P' should be reported.

Description of accepted values

P = physically settled without optionality. 'P' shall be reported for contracts that are settled physically (typical for spot/physical forwards). The field shall also be populated with 'P' in the case of derivative contracts relating to a wholesale energy product that must be physically settled. For contracts such as options on forwards/futures/swaps, the option settles into the underlying forward/future/swap. Since the underlying contract is considered for physical delivery, the value 'P' shall be reported.

C = cash settled without optionality. 'C' shall be reported for contracts that are settled in cash without an optionality, i.e. must be settled in cash.

P_OP = physically settled with optionality. 'P_OP' shall be reported for contracts that are physically settled while the market participant had an optionality over the settlement method.

C_OP = cash settled with optionality. 'C_OP' shall be reported for contracts that are settled in cash while the market participant had an optionality over the settlement method.

7.4. Data fields related to option details

Data Field (37) Option style

No	Field identifier	Description
37	Option style	The field indicates whether the option may be exercised only at a fixed date (European and Asian style), a series of pre-specified dates (Bermudan) or at any time during the life of the bilateral contract (American style) or depending on other conditions.

Representation in electronic format

<optionStyle>

Description of accepted values	Type	Length	Examples

A = American B = Bermudan E = European S = Asian O = Other	Text	1	B

Field description

This field identifies the option style, usually defined by the dates on which the option may be exercised: American, European, Bermudan, Asian or other.

An American-style option can be exercised at any time during its life, both prior to and on its maturity date. A European-style option can only be exercised on its maturity date. A Bermudan-style option can only be exercised on specified dates indicated in the bilateral contract.

Market participants should refer to financial markets to identify the option style they are reporting. Exotic option styles, such as binary, barrier, window options, etc., should be reported with the value 'O'.

In the case of 'other', market participants are expected to contact ACER for further guidance in order to select the most appropriate option style.

Data Field (38) Option type

No	Field identifier	Description
38	Option type	The field indicates whether the option is a call, put or other.

Representation in electronic format

<optionType>

Description of accepted values	Type	Length	Examples
P = Put C = Call O = Other	Text	1	C

Field description

This field identifies the type of right that the option holder owns, which may be a call option or a put option. 'C' shall be indicated if the option is a call option, and 'P' shall be indicated if the option is a put option. If the option holder owns a type of right different from a put or a call, the value 'O' for 'other' shall be reported in this field.

In the case of 'other', market participants are expected to contact ACER for further guidance in order to select the appropriate option type.

Reporting parties should refer to financial markets to identify the option type they are reporting.

Data Field (39) Option first exercise date

No	Field identifier	Description
39	Option first exercise date	The field indicates the first exercise date determined by the earliest date of all the exercises.

Representation in electronic format

<optionFirstExerciseDate>

Description of accepted values	Type	Length	Examples
ISO 8601 date format	Date	n/a	2026-01-29

Field description

This field identifies the first date at which the option holder has the right, but not the obligation, to buy or sell the commodity or the underlying instrument at a specified price using the index indicated in Data Field (42) Option strike index or the price reported in Data Field (45) Option strike price.

For example, the counterparty to the bilateral contract that holds the option may exercise, against the option strike index indicated in Data Field (42), the right to buy or sell the energy commodity from 01/01/2026 to 31/12/2028 (on specific dates or at specific intervals), in which case the market participant shall report '01/01/2026' in this field.

Where the bilateral contract has several indices and where each of them may be used to exercise the right to buy or sell the energy commodity, market participants shall report the first date at which the option can be exercised per each index reported in Data Field (42). For example:

1. the index ABC may be used to exercise the option from 2026-01-01 to 2027-12-31;
2. the index 123 may be used to exercise the option from 2027-04-01 to 2028-03-31; and
3. the index XYZ may be used to exercise the option from 2028-04-01 to 2029-03-31.

In this case, '2026-01-01', '2027-04-01' and '2028-04-01' shall be reported in this field for examples 1–3, respectively.

Data Field (40) Option last exercise date

No	Field identifier	Description
40	Option last exercise date	The field indicates the last exercise date determined by the latest date of all the exercises.

Representation in electronic format

<optionLastExerciseDate>

Description of accepted values	Type	Length	Examples
ISO 8601 date format	Date	n/a	2027-01-29

Field description

This field identifies the last date at which the option holder has the right, but not the obligation, to buy or sell the commodity or underlying instrument at a specified price using the index indicated in Data Field (42) Option strike index or the price reported in Data Field (45) Option strike price.

For example, the counterparty to the bilateral contract that holds the option may exercise, against the option strike index indicated in Data Field (42), the right to buy or sell the energy commodity from 01/01/2026 to 31/12/2028 (on specific dates or at specific intervals), in which case the market participant shall report '31/12/2028' in this field.

Where the bilateral contract has several indices and where each of them may be used to exercise the right to buy or sell the energy commodity, market participants shall report the last date at which the option can be exercised per each index reported in Data Field (42). For example:

1. the index ABC may be used to exercise the option from 2026-01-01 to 2027-12-31;
2. the index 123 may be used to exercise the option from 2026-04-01 to 2028-03-31; and
3. the index XYZ may be used to exercise the option from 2026-04-01 to 2029-03-31.

In this case, '2027-12-31', '2028-03-31' and '2029-03-31' shall be reported in this field for examples 1–3, respectively.

Data Field (41) Option exercise frequency

No	Field identifier	Description
41	Option exercise frequency	The field indicates the frequency of the volume optionality, such as daily, weekly, monthly, seasonal, annual or other.

Representation in electronic format

<optionExerciseFrequency>

Description of accepted values	Type	Length	Examples
D = Daily W = Weekly M = Monthly S = Seasonal A = Annual O = Other	Text	1	W

Field description

This field identifies the frequency at which the option holder has the right, but not the obligation, to buy or sell the commodity or underlying instrument at a specified price using the index indicated in Data Field (42) Option strike index or the price reported in Data Field (45) Option strike price.

For example, a counterparty to the bilateral contract that holds the option may exercise, against the option strike index indicated in Data Field (42), the right to buy or sell the energy commodity on a monthly basis, in which case the market participant shall report 'M' in this field. The same applies to the other types of frequencies.

Where the bilateral contract has several indices and where each of them may be used to exercise the right to buy or sell the energy commodity, market participants shall report the frequency at which the option can be exercised per each index reported in Data Field (42). For example:

1. the index ABC may be used to exercise the option from 2025-01-01 to 2027-12-31 on a daily basis;
2. the index 123 may be used to exercise the option from 2026-04-01 to 2028-03-31on a monthly basis; and
3. the index XYZ may be used to exercise the option from 2012-04-01 to 2029-03-31 on a weekly basis.

In this case, 'D', 'M' and 'W' shall be reported in this field for examples 1–3, respectively.

In the case of 'Other', market participants are expected to contact ACER for further guidance in order to select the appropriate frequency type.

Data Field (42) Option strike index

No	Field identifier	Description
42	Option strike index	The field indicates the name of each option strike index. In case of a basket of indices for which no unique identifier exists, the basket or the index shall be indicated.

Representation in electronic format

<optionStrikeIndex>

Description of accepted values	Type	Length	Examples
Up to 150 alphanumerical digits	Alphanumeric	150	Index name

Field description

This field identifies the name of the strike index used in the index option embedded in the bilateral contract. Market participants shall report the name of the index in this field.

An index option is a call or put option contract in which the underlying asset is an index of any sort. For example, in a call, a market participant may buy the right to an index on or before the expiration date at a certain strike index.

Some options, both derivative and non-derivative, related to physical delivery of gas or electricity are traded on the basis that the option may be exercised against an index or reference price upon its publication.

Market participants shall report the name of the index as advertised by the publisher.

If the index is not public, market participants should make best efforts to minimise any discrepancy with the other market participant when reporting this information.

Market participants may consider using the following convention:

[commodity]-[delivery area]-[delivery period]-[index name]-[publisher name]

For example:

1. GAS-DAYAHEAD-INDEX-PUBLISHERNAME;
2. GAS-EU-FRONTMONTH-AVERAGEPRICE-PUBLISHERNAME;
3. ELECTRICITY-COUNTRY A-FRONTMONTH-FUTURE-EXCHANGENAME.

Data Field (43) Option strike index type

No	Field identifier	Description
43	Option strike index type	The field indicates the type of the option strike index, such as spot, forward, swap, spread or other.

Representation in electronic format

<optionIndexType>

Description of accepted values	Type	Length	Examples
SO = Spot FW = Forward style contract FU = Future style contract OP = Option style contract OP_FW = Option on a forward OP_FU = Option on a future OP_SW = Option on a swap SP = Spread SW = Swap OT = Other	Text	2	FW

Field description

This field identifies the type of strike index of the option used in the bilateral contract, as reported in Data Field (42). For each index, market participants shall specify the type of index.

For example, if the index is a spot price published by an exchange, the value ‘SO’ shall be reported.

If the index is published by a price-reporting agency or other publisher and it represents the delivery of the energy commodity during a specific day, week, weekend, month, etc., the value ‘FW’ shall be reported. If the index is a future price published by an exchange, the value ‘FU’ shall be reported.

Where the bilateral contract has several indices and where each of them may be used to exercise the right to buy or sell the energy commodity, market participants shall report the type of index used against which the option can be exercised per each index reported in Data Field (42) Option strike index. For example:

1. the spot price published by exchange ABC may be used to exercise the option from 2026-01-01 to 2027-12-31;
2. the index value for a forward contract published by publisher 123 may be used to exercise the option from 2026-04-01 to 2028-03-31; and
3. the future price published by exchange XYZ may be used to exercise the option from 2026-04-01 to 2029-03-31.

In this case, ‘SO’, ‘FW’ and ‘FU’ shall be reported in this field for examples 1–3, respectively.

In the case of ‘other’, market participants are expected to contact ACER for further guidance in order to select the appropriate index type.

Data Field (44) Option strike index source

No	Field identifier	Description
44	Option strike index source	The field indicates the publication source for each index. In case of a basket of indices for which no unique identifier exists, the basket or the index shall be indicated.

Representation in electronic format

<optionIndexSource>

Description of accepted values	Type	Length	Examples
Up to 150 alphanumerical digits	Alphanumeric	100	Index source name

Field description

This field identifies the source of strike index of the option used in the bilateral contract, as reported in Data Field (42) Option strike index. For each index, market participants shall specify the source of the index.

For example, if the index is a spot price published by exchange ABC, the name of the exchange shall be reported. If the index is published by a price-reporting agency or other publisher, the name of the publisher shall be reported.

Where the bilateral contract has several indices and where each of them may be used to exercise the option, market participants shall report the source of each index reported in Data Field (42) Option strike index against which the option can be exercised. For example:

1. the spot price published daily by the exchange ABC may be used to exercise the option from 2026-01-01 to 2027-12-31;
2. the index value for a forward contract published by publisher 123 may be used to exercise the option from 2026-04-01 to 2028-03-31; and
3. the future price published by the exchange XYZ may be used to exercise the option from 2026-04-01 to 2029-03-31.

In this case, ‘exchange ABC’, ‘publisher 123’ and ‘exchange XYZ’ shall be reported in this field for examples 1–3, respectively.

Data Field (45) Option strike price

No	Field identifier	Description
45	Option strike price	The field indicates the strike price of the option.

Representation in electronic format
<optionStrikePrice>

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of five decimals	Number	20	125.98

Field description

This field identifies the price at which the owner of the option can buy (in the case of a call option) or sell (in the case of a put option) the energy commodity (gas or electricity) or the instrument, as indicated in the option contract, for example future/forward/swap.

This field shall be reported only if the strike price is available. In the case of an option strike index where the strike price is not available, this field is not applicable.

Where the option has several strike prices and where each of them may be used to exercise the right to buy or sell the energy commodity, market participants shall report all the strike prices at which the option can be exercised.

7.5. Data fields related to delivery profile

Data Field (46) Delivery point or zone

No	Field identifier	Description
46	Delivery point or zone	The field indicates the EIC codes for the delivery points or market areas.

Representation in electronic format
<deliveryPointOrZone>

Description of accepted values	Type	Length	Examples
EIC code, 16-character alphanumeric code	Alphanumeric	16	10YCB-EUROPEU–8

Field description

This field should indicate the EIC Y, Z or W code to identify the delivery point or zone for the bilateral contract.

Any bilateral contract related to the supply of electricity or gas, irrespective of whether it is a spot, a physical forward, a future or an option contract, has a reference to a delivery point or zone. Also, financial derivatives related to EU electricity or gas have a reference price or other attributes that relate to the delivery of the commodity.

For more information, see Section 2.3.

Data Field (47) Delivery start date

No	Field identifier	Description
47	Delivery start date	The field indicates the start date and time of delivery. For physically delivered contracts this would be the delivery start date stated in the bilateral contract.

Representation in electronic format

<deliveryStartDateTime>

Description of accepted values	Type	Length	Examples
ISO 8601 date format	Date	n/a	2026-01-01

Field description

This field identifies the start date of delivery of the commodity under the reported bilateral contract.

Data Fields (46) and (47), for delivery start date and delivery end date, respectively, are mandatory fields. However, ACER is aware of the fact that, given the characteristics of some bilateral contracts reported in Table 2, it is not always possible to report both fields when reporting the contract in Table 2. If the delivery start date is unknown, by default, '1900-01-01' should be reported in this field.

Data Field (48) Delivery end date

No	Field identifier	Description
48	Delivery end date	The field indicates the end date and time of delivery. For physically delivered contracts this would be the end delivery date of the bilateral contract.

Representation in electronic format

<deliveryEndDateTime>

Description of accepted values	Type	Length	Examples
ISO 8601 date format	Date	n/a	2027-01-31

Field description

This field identifies the end date of delivery of the commodity under the reported bilateral contract.

Data Fields (46) and (47), for delivery start date and delivery end date, respectively, are mandatory fields. However, ACER is aware of the fact that, given the characteristics of some bilateral contracts reported in Table 2, it is not always possible to report both fields when reporting the contract in Table 2. If the delivery end date is unknown, by default, '2100-12-31' should be reported in this field.

Data Field (49) Number of periods

No	Field identifier	Description
49	Number of periods	The field indicates the number of time units where the quantity is delivered (as derived from the delivery profile), applying hourly resolution, if applicable.

Representation in electronic format

<numberOfPeriod>

Description of accepted values	Type	Length	Examples
Up to 20 numerical digits in the format xxxxx.yyyyy with a maximum of five decimals	Number	20	120

Field description

This field represents the calculated number of time units over which the quantity is delivered, based on the delivery profile and using an hourly resolution. It reflects the total count of distinct hourly periods over which deliveries occur within the bilateral contract's time frame.

Market participants should derive this value directly from the delivery schedule, ensuring that it aligns with the reported delivery start and end dates and the specified load type. The calculation should account for all applicable hours in which delivery occurs.

For example, under a baseload ('BL') contract starting on 1 January at 00:00:00 and ending on 6 January at 00:00:00, the number of hourly periods would be calculated as *5 days* × *24 hours* = *120 periods*. The value to be reported in this field is therefore '120'.

Bilateral contract with non-continuous deliveries (e.g. peak-load ('PL'), off-peak-load ('OP'), shaped ('SH')) shall only include the periods corresponding to the specific delivery profile.

This field is only applicable to non-standard contracts with a **fixed delivery profile**. If the delivery profile is not fixed, there is no expectation to provide the number of periods in this data field, or to provide an estimation.

Data Field (50) Load type

No	Field identifier	Description
50	Load type	The field indicates the type of the delivery profile.

Representation in electronic format

<loadType>

Description of accepted values	Type	Length	Examples
BL = Baseload PL = Peak-load OP = Off-Peak load BH = Hour/Block Hours SH = Shaped GD = Gas-Day OT = Other	Text	2	BL

Field description

This field identifies the delivery profile (baseload, peak-load, off-peak-load, block of hours or other) of the bilateral contract. The load type should be identified as defined in the bilateral contract, if available.

BL = Baseload. The contracted volume to supply electricity is delivered continuously for all 24 hours of the day.

PL = Peak-load. The product is delivered only during the peak-demand hours of the day, rather than continuously like in a baseload contract. Peak hours may vary by Member State, but a common definition in many European power markets is from Monday to Friday, starting from 07:00 or 08:00 until 19:00 or 20:00, respectively (excluding weekends and holidays).

OP = Off-peak-load. The product is delivered during all the hours outside the defined peak-load period. Off-peak hours depend on the market, but a common definition in many European power markets is from Monday to Friday, starting from 19:00 or 20:00 until 07:00 or 08:00, respectively, including weekends and holidays.

BH = Hour/Block Hours. The product is delivered in a predefined set of hours each day (fixed hourly blocks), distinguishing it from baseload, peak-load or off-peak-load delivery profiles.

SH = Shaped. A contract that is considered to have a customised delivery profile, i.e. it specifies the amount of energy to be bought or sold at different points in time in order to allow the market participant to meet their specific needs.

GD = Gas-day. Natural gas is delivered continuously during the day, typically from 06:00 to 06:00 the next day. For within-day contracts where the delivery of the gas is running from a certain hour of the gas day until 06:00 the next day, load type ‘GD’ is considered applicable.

OT = Other. If a delivery profile is not defined, market participants shall report ‘OT’ for ‘Other’. In the case of value ‘OT’, market participants are expected to contact ACER for further guidance in order to select the appropriate delivery profile type.

For the application of the correct load type for a specific product or contract, see the examples available in Annex II to the TRUM.

7.6. Data field related to lifecycle information

Data Field (51) Action type

No	Field identifier	Description
51	Action type	When the report refers to: • a bilateral contract reported for the first time, it will be identified as ‘new’;

		• a modification of details of a previously reported bilateral contract, it will be identified as 'modify'; • a cancellation of a wrongly reported bilateral contract, it will be identified as 'error'; • a termination of an outstanding bilateral contract, it will be identified as 'cancel'.

Representation in electronic format

<actionType>

Description of accepted values	Type	Length	Examples
N = New M = Modify E = Error C = Cancel	Text	1	N

Field description

This field identifies the type of action representing a lifecycle event that occurred in relation to the bilateral contract that is being reported.

The requirements for reporting lifecycle events related to transactions reportable in Table 1 and Table 2 are described in detail in Annex I to the TRUM.

The field is mandatory for all bilateral contracts reported in Table 2.

Description of the accepted values

Action type N ('new') always indicates the first event in any transaction's lifecycle. This implies that the first contract record shall always be reported with Action type N. A subsequent record with Action type M, C or E can be accepted by ARIS only if a record with Action type N has been successfully reported previously. The first submission of a non-standard contract is an event that will be identified as 'new'.

Action type M ('modify') shall be adopted in case there is a modification of the previously submitted record, which is triggered by a business decision or is the result of a business event. An example of a report modification is when two parties agree to amend one or more terms of the original agreement (e.g. price, quantity or any other value previously reported).

Action type C ('cancel') indicates the last event in the lifecycle sequence, triggered by a business decision or resulting from a business event. For example, at any time during the term of a contract, the counterparties may agree to terminate the contract early (i.e. before its natural maturity date).

Action type E ('error') shall be used if the reporting party needs to indicate that the previously submitted record was erroneously reported, meaning that it was incorrect. Any correction to the already reported information using Action type E will result in a logical deletion (i.e. invalidation) of the corresponding record, which was previously successfully reported. It will, however, not delete the previously reported record from the ARIS database. Reporting an event with Action type E cannot be the result of a business decision, for example to change the economic values, such as price or quantity.

For further information on the application of the different action types, see Annex I to the TRUM.

8. Data fields related to electricity transportation contracts to be reported in Table 3

Technical and business requirements when submitting the transaction record

In this chapter, ACER provides information on how the data fields listed in Table 3 of the Annex to the REMIT Implementing Regulation shall be populated for the reporting of both standard and non-standard electricity transportation contracts.

It is worth noting that not all data fields are mandatory for all transactions. Data fields are expected to be populated when applicable, according to this manual. ACER has prepared a list of trading scenarios to show what is expected and applicable to each scenario. The trading scenarios are listed in Annex II to the TRUM.

Cardinality table of data fields included in Table 3

Field no.	Field name
Common data for total primary allocation results and secondary market resale and transfer rights and bid document	
1	Document identification
2	Document version
3	Document type
4	Sender identification
5	Sender role
6	TSO identification
7	Market participant identification (secondary allocation)
8	Receiver identification
9	Receiver role
10	Creation date and time
11	Bid time interval/applicable time interval
12	Domain
13	Document status (if applicable)
Capacity allocation time series (for primary allocation)	
14	Time series identification
15	Bid document identification
16	Bid document version
17	Bid identification
18	Bidding party
19	Auction identification
20	Organised marketplace identification
21	Business type
22	In area
23	Out area
24	Contract type
25	Contract identification

26	Measure unit quantity
27	Currency (if applicable)
28	Measure unit price (if applicable)
29	Curve type (if applicable)
30	Classification category (if applicable)
Auction Specification Data	
31	Timetable
32	Offered capacity
33	Available transmission capacity
34	Return capacity
No-Bid auction time series (for primary allocation)	
35	Identification
36	Auction identification
37	Classification category (if applicable)
Secondary rights time series (for secondary rights)	
38	Time series identification
39	Business type
40	In area
41	Out area
42	Rights holder
43	Transferee party (if applicable)
44	Contract identification
45	Contract type
46	Previous contract identification (if applicable)
47	Measure unit quantity
48	Auction identification (if applicable)
49	Currency (if applicable)
50	Measure unit price (if applicable)
51	Curve type (if applicable)
Period for primary allocation and secondary processes	
52	Time interval
53	Resolution
Interval for primary allocation and secondary processes	
54	Position
55	Quantity
56	Price amount (if applicable)
57	Bid quantity (if applicable)
58	Bid price amount (if applicable)
Reason for primary allocation and secondary processes	
59	Reason code (if applicable)
60	Reason text (if applicable)
Bid header document and bid document fields for organised marketplaces (applicable for secondary trading)	

61	Subject party
62	Subject role
63	Divisible
64	Linked bids identification (if applicable)
65	Block bid

8.1. Data fields related to common data for total primary allocation results and secondary market resale and transfer rights and bid document

Data Field (1) Document identification

No	Field identifier	Description
1	Document identification	The field indicates the document by a unique identification code for which the time series data is being supplied.

Representation in electronic format

<mRID>

Description of accepted values	Type	Length	Examples
Sender unique identification	String	Maximum 35	A_R-IT-FR-I-HOURLY1624-140709-01

Field description

This field indicates the unique identification of the document for which the time series data is being supplied. A bid document for a given time series set and a given bid period must have a unique identification assigned by the sender of the document for all transmissions to the receiver.

All additions, modifications or suppressions for the time series and bid period must use the same identification.

This field is always mandatory.

Data Field (2) Document version

No	Field identifier	Description
2	Document version	The field indicates the version of the document being sent. A document may be sent several times, each transmission being identified by a different version number that starts at 1 and increases sequentially.

Representation in electronic format

<revisionNumber>

Description of accepted values	Type	Length	Examples
An integer value starting with 1. 1 2 3 … 999	Integer	Maximum 3	1

Field description

This field identifies the document version. The document version is used to identify a given version of a time series set for a given bid period. The first version number for a given document identification shall normally be 1. The document version number must be incremented for each retransmission of a document that contains changes to the previous version. The version number shall always be greater than the previous version number of the same document.

Data Field (2) plays an important role when the document has to be deleted. More specifically, in order to delete incorrect bids or total allocation reports, Data Field (2) Document version has to be updated, as described above. To withdraw these documents, a higher version of the relevant document, containing only a header and no TimeSeries, should be sent.

This field is always mandatory.

Data Field (3) Document type

No	Field identifier	Description
3	Document type	The field indicates the coded type of the document being sent.

Representation in electronic format

<type>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for valid codes. A24 = bid document	Alphanumeric	3 (no blanks)	A24

Field description

This field identifies the document type.

The document type identifies the information flow characteristics. The initial code to be used is ‘A24’ (bid document).

This field is always mandatory.

Data Field (4) Sender identification

No	Field identifier	Description
4	Sender identification	The field identifies the RRM by its ACER registration code that is the sender of the document.

Representation in electronic format

Sender_MarketParticipant

Description of accepted values	Type	Length	Examples
ACER code	Alphanumeric	12	A0643278W.EU

Field description

For the purpose of REMIT reporting, this field shall identify the ACER code of the RRM that is the sender of the document being reported on behalf of the OMP or the market participant.

This field is always mandatory.

Data Field (5) Sender role

No	Field identifier	Description
5	Sender role	The field indicates the role that is played by the sender.

Representation in electronic format

<marketRole.type>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes. A07 = transmission capacity allocator A39 = data provider	Alphanumeric	Maximum 3	A07

Field description

This field indicates the role of the sender of the document. The sender of the document always needs to be registered as an RRM; however, its role may depend on the operational process it carries out, such as transmission capacity allocator. The sender may also be a third-party RRM.

For the list of acceptable codes, see the relevant ENTSO-E code list on StandardRoleTypeList.

This field is always mandatory.

Data Field (6) TSO identification

No	Field identifier	Description
6	TSO identification	The field identifies the TSO by a unique identification code on whose behalf the RRM is reporting.

Representation in electronic format
Sender_MarketParticipant

Description of accepted values	Type	Length	Examples
EIC	Alphanumeric	16	10X1001A1001A450

Field description

This field shall identify the TSO on whose behalf the RRM is reporting the primary allocation in which the TSO acted as the transmission capacity allocator.

The relevant TSO shall be identified by its EIC code.

This field is mandatory for primary allocations.

Data Field (7) Market participant identification (secondary allocation)

No	Field identifier	Description
7	Market participant identification (secondary allocation)	The field identifies the market participant by a unique identification code on whose behalf the RRM is reporting the secondary allocations.

Representation in electronic format
Sender_MarketParticipant

Description of accepted values	Type	Length	Examples
EIC	Alphanumeric	16	10X1001A1001A450

Field description

The field shall identify the market participant on whose behalf the RRM is reporting the secondary allocation.

The secondary allocation, if registered on an OMP, shall be reported to ACER by the OMP (via a chosen RRM) on behalf of the market participant.

Data Field (8) Receiver identification

No	Field identifier	Description

8	Receiver identification	The field identifies the party who is receiving the document.

Representation in electronic format
Receiver_MarketParticipant

Description of accepted values	Type	Length	Examples
EIC	Alphanumeric	16	10X1001A1001A450

Field description

This field identifies the party receiving the document. The receiver of the document is identified by a unique coded identification. In general, this identifies the auction office or its representative.

The codification scheme used for the coded identification is indicated by the coding scheme attribute. It is a three-character alphanumeric code.

This field is mandatory.

Data Field (9) Receiver role

No	Field identifier	Description
9	Receiver role	The field indicates the role played by the receiver.

Representation in electronic format
<marketRole.type>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes. A32 = market information aggregator	Alphanumeric	3	A32

Field description

This field indicates the receiver role, which identifies the role of the receiver of the document.

For REMIT transaction reporting purposes, the code ‘A32’ (market information aggregator) is expected to be used.

This field is always mandatory.

Data Field (10) Creation date and time

No	Field identifier	Description
10	Creation date and time	The field indicates the date and time of the creation of the document.

Representation in electronic format
<createdDateTime>

Description of accepted values	Type	Length	Examples
ISO 8601 date format using UTC	Date and time	30	2026-01-29T10:35:56Z

Field description

This field indicates the date and time when the document was prepared for transmission by the sender.

This field is mandatory.

Data Field (11) Bid time interval/applicable time interval

No	Field identifier	Description
11	Bid time interval/applicable time interval	The field indicates the beginning and ending date and time of the period covered by the document.

Representation in electronic format
period.timeInterval <start>
period.timeInterval <end>

Description of accepted values	Type	Length	Examples
ISO 8601 date format using UTC	Date and time	41	2026-03-01T13:00Z/2027-05-11T15:30Z

Field description

This field identifies the start and end date and time of the period covered by the document. The receiver will discard any time intervals outside the bid period.

The field is reported in two different fields in the schema, i.e. start date and end date.

This field is mandatory.

Data Field (12) Domain

No	Field identifier	Description

12	Domain	The field indicates the domain covered within the document.

Representation in electronic format
<domain.mRID>

Description of accepted values	Type	Length	Examples
EIC	Alphanumeric	16	10Y0000123456789

Field description

This field identifies the domain that is covered in the bid document and specifies what auction identifications may be used.

This field is always mandatory.

Data Field (13) Document status

No	Field identifier	Description
13	Document status	The field indicates the status of the document.

Representation in electronic format
<docStatus>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes. A01 = intermediate A02 = final A13 = withdrawn	Alphanumeric	3 characters	A02

Field description

This field shall identify the status of the document according to the ENTSO-E code list on StandardStatusTypeList.

It is important to note that, for deleting an incorrectly reported rights document, the code ‘A13’ shall be used in this field.

This field is mandatory for secondary allocations, such as rights resale or rights transfer.

8.2. Data fields related to capacity allocation time series (for primary allocation)

Data Field (14) Time series identification

No	Field identifier	Description
14	Time series identification	The field indicates the unique identification of the time series.

Representation in electronic format

TimeSeries <mRID>

Description of accepted values	Type	Length	Examples
Time series unique identification	Alphanumeric	Maximum 35	TotalAllocationResults_TS_2099333 or 1432_137_42_40_559

Field description

This field identifies the time series using a unique number that is assigned by the OMP to each time series in the document.

This field is mandatory.

Data Field (15) Bid document identification

No	Field identifier	Description
15	Bid document identification	The field indicates the identification of the document in which the bids or resale references are contained.

Representation in electronic format

Bid_MarketDocument <mRID>

Description of accepted values	Type	Length	Examples
Unique bid document identification	Alphanumeric	Maximum 35	AA-BB-T-PROUCTXXX-YYMMDD-01 or 1432_11XTEST——1_42_40

Field description

This field identifies the document containing the referenced bids. Each allocated bid is contained in the bid document sent by the user.

This field is mandatory.

Data Field (16) Bid document version

No	Field identifier	Description

16	Bid document version	The field indicates the version of the bid or resale document having been sent.

Representation in electronic format
Bid_MarketDocument <revisionNumber>

Description of accepted values	Type	Length	Examples
An integer value starting with 1. 1 2 3 … 999	Integer	Maximum 3	1

Field description

This field identifies the document version of the bid document.

This field is mandatory.

Data Field (17) Bid identification

No	Field identifier	Description
17	Bid identification	The field indicates the identification of the time series that was used in the original bid or resale, if applicable, as assigned by the bidder when they made their original bid or resale.

Representation in electronic format
Bid_TimeSeries <mRID>

Description of accepted values	Type	Length	Examples
Unique time series document identification	Alphanumeric	Maximum 35	BID00001

Field description

This field uniquely identifies the bid. This is the unique number that is assigned by the bidder when they make the original bid.

This field is mandatory.

Data Field (18) Bidding party

No	Field identifier	Description

18	Bidding party	The field identifies the market participant submitting the bid for the capacity or resold capacity (EIC X code).

Representation in electronic format
<bidDocument_MarketDocument.biddingParty_MarketParticipant.mRID>

Description of accepted values	Type	Length	Examples
EIC X	Alphanumeric	16	10X1001A1001A450

Field description

The field shall identify the market participant who bid for the capacity or resold capacity through its EIC X-type code.

This field is mandatory.

Data Field (19) Auction identification

No	Field identifier	Description
19	Auction identification	The field indicates the identification linking the allocation to a set of specifications created by the auction operator.

Representation in electronic format
<auction.mRID>

Description of accepted values	Type	Length	Examples
Unique identification that clearly identifies the auction to which the bid is addressed	Alphanumeric	Maximum 35	AT-CH-M-BASE—-140801-01

Field description

This field shall identify the auction to which the bid is addressed by a unique identification code assigned by the auction operator (i.e. the OMP).

This field is mandatory.

Data Field (20) Organised marketplace identification

No	Field identifier	Description
20	Organised marketplace identification	The field identifies the organised marketplace by a unique code where the capacity was offered.

Representation in electronic format

<organisedMarketPlace_MarketParticipant.identification>

Description of accepted values	Type	Length	Examples
LEI MIC ACER code	Alphanumeric	20 4 12	1234567890abcdefrgf MICX C0643278W.EU

Field description

This field identifies the OMP where the capacity was offered.

If the allocation was executed on an OMP, the relevant OMP must be identified via its ACER, LEI or MIC code, as reported in the 'List of organised marketplaces' published by ACER.

Where the allocation procedure (primary or secondary) does not take place on an OMP (e.g. bilateral allocation), this field shall be populated with the default value '21X-XXXXXXXXXXXY'.

Data Field (21) Business type

No	Field identifier	Description
21	Business type	The field indicates the nature of the time series.

Representation in electronic format

<businessType>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes. A03 = external trade explicit capacity	Alphanumeric	3	A03

Field description

This field indicates the nature of the time series according to the ENTSO-E code list on StandardBusinessTypeList.

This field is mandatory.

Data Field (22) In area

No	Field identifier	Description
22	In area	The field indicates the area where the energy is to be delivered (EIC Y code).

Representation in electronic format

<in_Domain.mRID>

Description of accepted values	Type	Length	Examples
EIC	Alphanumeric	16	10Y0000123456789

Field description

This field shall identify the area where the energy is going through its EIC Y-type code.

This field is mandatory.

Data Field (23) Out area

No	Field identifier	Description
23	Out area	The field indicates the area where the energy is coming from (EIC Y code).

Representation in electronic format

<out_Domain.mRID>

Description of accepted values	Type	Length	Examples
EIC	Alphanumeric	16	10Y0000123456789

Field description

This field identifies the area where the energy is coming from through its EIC Y-type code.

This field is mandatory.

Data Field (24) Contract type

No	Field identifier	Description
24	Contract type	The field indicates the contract type that defines the conditions under which the capacity was allocated and/or offered, such as daily, weekly, monthly, yearly, long-term contracts or other.

Representation in electronic format
<contract_MarketAgreement.type>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes. A01 = Daily A02 = Weekly A03 = Monthly A04 = Yearly	Alphanumeric	3	A01

Field description

This field defines the conditions under which the capacity was allocated and handled. The significance of this type is dependent on the in-area and out-area specific coded working methods. The transmission capacity allocator responsible for the area in question defines the contract type to be used, for example daily auction, weekly auction, monthly auction, yearly auction, long-term contract, according to the ENTSO-E code list on StandardContractTypeList.

This field is mandatory.

Data Field (25) Contract identification

No	Field identifier	Description
25	Contract identification	The field indicates the contract identification of the time series instance by using a unique code as assigned by the organised marketplace and used for all references to the allocation.

Representation in electronic format
<contract_MarketAgreement.mRID>

Description of accepted values	Type	Length	Examples
Capacity agreement identifications (CAIs)	Alphanumeric	Maximum 35	3105105CY601

Field description

This field provides an identification that uniquely identifies the allocation. This must be a unique number that is assigned by the OMP and shall be used for all references to the allocation.

This field is mandatory for the assigning party, if capacity was allocated.

Data Field (26) Measure unit quantity

No	Field identifier	Description
26	Measure unit quantity	The field indicates the unit of measure in which the quantity in the time series is expressed.

Representation in electronic format

<quantity_Measurement_Unit.name>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes.	Alphanumeric	Maximum 3	MWH

Field description

This field indicates the unit of measurement used for the quantities expressed within the time series.

This information is mandatory.

Data Field (27) Currency (if applicable)

No	Field identifier	Description
27	Currency (if applicable)	The field indicates the currency in which the monetary amount is expressed.

Representation in electronic format

<currency_Unit.name>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes.	Alphanumeric	Maximum 3 ISO 4217	EUR

Field description

This field indicates the currency used for the monetary amount expressed within the time series according to the ENTSO-E code list on StandardCurrencyTypeList.

This information is mandatory, if available.

Data Field (28) Measure unit price (if applicable)

No	Field identifier	Description
28	Measure unit price (if applicable)	The field indicates the unit of measure in which the price in the time series is expressed.

Representation in electronic format

<price_Measurement_Unit.name>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes.	Alphanumeric	Maximum 3	MWh

Field description

This field indicates the unit of measurement used for the price expressed within the time series (MW per unit, MWh per unit, etc.) according to the EIC code list on StandardUnitOfMeasureTypeList.

This information is mandatory, if available.

Data Field (29) Curve type (if applicable)

No	Field identifier	Description
29	Curve type (if applicable)	The field indicates the type of the curve that is being provided for the time series in question, such as variable-size block or fixed-size block, point or other.

Representation in electronic format

<curveType>

Description of accepted values	Type	Length	Examples
Refer to ENTSO-E Code list for data interchange document for the valid list of codes A01 = Sequential fixed size blocks A02 = Points A03 = Variable sized blocs A04 = Overlapping breakpoints A05 = Non-overlapping breakpoints	Alphanumeric	Maximum 3	A01

Field description

This field represents the coded identification of the curve that is described in the period and interval class according to the ENTSO-E code list on StandardCurveTypeList.

If the 'curve type' element is omitted in the XML instance, a default value of 'sequential fixed-size blocks' shall be understood. The sequential fixed-size blocks (A01) curve is made of successive intervals of time (blocks) of constant duration (size), where the size of blocks is equal to the resolution of the period. The value of the quantity remains constant within each block.

Data Field (30) Classification category (if applicable)

No	Field identifier	Description
30	Classification category (if applicable)	The field indicates the category of the product as defined by the market rules.

Representation in electronic format
<auction.category>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E core component code list document for valid codes. The following codes have been initially defined: A01 = Base A02 = Peak A03 = Off-peak A04 = Hourly	Alphanumeric	3	A01

Field description

This field provides the basic category of the auction and describes what hours of the day are being auctioned according to the ENTSO-E code list on StandardCategoryTypeList.

This information is mandatory.

8.3. Data fields related to auction specification data

Data Field (31) Timetable

No	Field identifier	Description
31	Timetable	The field indicates the gate closure time of the auction.

Representation in electronic format
<closing_DateAndOrTime>

Description of accepted values	Type	Length	Examples
ISO 8601 date format using UTC	Date and time	41	2026-03-01T13:15Z

Field description

This field shall identify the gate closure time of the auction, as specified by the OMP organising the auction.

The field is mandatory for primary allocations.

Data Field (32) Offered capacity

No	Field identifier	Description
32	Offered capacity	The field indicates the offered capacity in the auction (in MW).

Representation in electronic format
<offeredCapacity_Quantity.quantity>

Description of accepted values	Type	Length	Examples
The maximum length of this information is 17 numeric characters (decimal mark included).	Numeric	Maximum 17	10.8

Field description

This field shall identify the total capacity offered by the relevant TSO at the auction, as identified in Data Field (19) Auction identification.

In general, for monthly and yearly auctions, the offered capacity is understood as the sum of the available transmission capacity (ATC) and the capacity returned to the auction. For an initial yearly auction, there is no preceding long-term allocation time frame from which capacity can be returned, but returned capacity may be available in subsequent yearly auction rounds and included in the offered capacity.

For explicit day-ahead auctions, the offered capacity and ATC are equal.

The capacity reported in Data Field (32) shall not include the capacity that was returned to the auction from the secondary market. The return capacity is to be indicated in Data Field (34).

The field is to be populated by the OMP reporting the auction with the applicable offered capacity.

The offered capacity shall always be expressed in MW. The number of decimal places identifying the fractional part of the quantity depends on local market rules.

The field is mandatory for primary allocations.

Data Field (33) Available transmission capacity

No	Field identifier	Description
33	Available transmission capacity	The field indicates the available transmission capacity in the auction (in MW).

Representation in electronic format
<transCapacity_Quantity.quantity>

Description of accepted values	Type	Length	Examples
The maximum length of this information is 17 numeric characters (decimal mark included).	Numeric	Maximum 17	10.8

Field description

This field shall identify the ATC available at the auction, as identified in Data Field (19) Auction identification.

The field is to be populated by the OMP reporting the auction with the applicable ATC.

The ATC value shall always be expressed in MW. The number of decimal places identifying the fractional part of the quantity depends on local market rules.

The field is mandatory for primary allocations.

Data Field (34) Return capacity

No	Field identifier	Description
34	Return capacity	The field indicates the return capacity in the auction (in MW).

Representation in electronic format
< returnCapacity_Quantity.quantity>

Description of accepted values	Type	Length	Examples
The maximum length of this information is 17 numeric characters (decimal mark included).	Numeric	Maximum 17	10.8

Field description

This field shall identify the total capacity returned to the auction, as identified in Data Field (19) Auction identification.

The field is to be populated by the OMP reporting the auction where the capacity was returned.

In the section *AuctionSpecificationData* in the electronic format, the ID of the auction where the capacity was **originally** allocated shall be reported, together with the information on the capacity that has been returned to the auction, as identified in Data Field (19). In addition, the ID of the market participant returning the capacity to the auction (as identified in Data Field (19)) is also expected to be reported.

The return capacity shall always be expressed in MW. The number of decimal places identifying the fractional part of the quantity depends on local market rules.

The field is mandatory for primary allocations when the auction offers capacity that was previously returned from the secondary allocation to the auction.

8.4. Data fields related to no-bid auction time series (for primary allocation)

Data Field (35) Identification

No	Field identifier	Description
35	Identification	The field indicates the identification of a time series instance.

Representation in electronic format

<NoBid_TimeSeries> <mRID>

Description of accepted values	Type	Length	Examples
Time series unique identification	Alphanumeric	Maximum 35	1432_275_66_43_1207

Field description

This field provides an identification that uniquely identified the no-bid auction time series. There may be several no-bid auction time series classes for a total allocation results document. Each time series identifies an auction where no market participant bids have been received.

Data Field (36) Auction identification

No	Field identifier	Description
36	Auction identification	The field identifies the auction where no bids have been received.

Representation in electronic format

<NoBid_TimeSeries> <noBid_Auction.mRID>

Description of accepted values	Type	Length	Examples
Identification of a no-bid auction	Alphanumeric	Maximum 35	1432_275_66_44_1805

Field description

This field provides the identification of the auction where no bids have been received.

Data Field (37) Classification category (if applicable)

No	Field identifier	Description
37	Classification category (if applicable)	The field indicates the category of the product as defined by the market rules.

Representation in electronic format

<NoBid_TimeSeries> <noBid_Auction.category>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E core component code list document for valid codes. The following codes have been initially defined: A01 = Base A02 = Peak A03 = Off-peak A04 = Hourly	Alphanumeric	3	A01

Field description

This field provides the classification category identifying the type of auction that is being held in respect of a given time period.

This field is mandatory, if applicable.

8.5. Data fields related to secondary rights time series (for secondary rights)

Data Field (38) Time series identification

No	Field identifier	Description
38	Time series identification	The field identifies the time series instance by a unique identification code as assigned by the sender for each time series in the document.

Representation in electronic format

<mRID>

Description of accepted values	Type	Length	Examples
Time series unique identification	Alphanumeric	Maximum 35	RS123446928 or 1432_137_42_40_559

Field description

This field provides a unique number that is assigned by the sender to each time series in the document.

This field is mandatory.

Data Field (39) Business type

No	Field identifier	Description
39	Business type	The field indicates the nature of the time series, such as capacity rights, capacity transfer notification or other.

Representation in electronic format

<businessType>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list codes. A32 = Capacity transfer notification A57 = Resale pricing	Alphanumeric	3	A57

Field description

This field indicates the nature of the time series concerning the rights by using the relevant code from the ENTSO-E code list on StandardBusinessTypeList.

It is important to distinguish between returns and transfers.

Code ‘A32’ refers to the notification of the transfer of capacity to another market participant. Transfer is considered applicable when one market participant transfers the capacity allocated to them previously via the primary allocation to another market participant on the secondary market. Therefore, this code shall be used in the case of secondary allocations.

Code ‘A57’ refers to the resold capacity and is expected to be used when the market participant that acquired capacity previously via a primary allocation returns the capacity back to another auction.

This field is mandatory.

Data Field (40) In area

No.	Field Identifier	Description
40	In area	The field indicates the area where the energy is to be delivered (EIC Y Code).

Representation in electronic format
<in_Domain.mRID>

Description of accepted values	Type	Length	Examples
EIC	Alphanumeric	16	10Y0000123456789

Field description

This field identifies the area where the energy is going through its EIC Y-type code.

This field is mandatory.

Data Field (41) Out area

No.	Field Identifier	Description
41	Out area	The field indicates the area where the energy is coming from (EIC Y Code).

Representation in electronic format
<out_Domain.mRID>

Description of accepted values	Type	Length	Examples
EIC Y	Alphanumeric	16	10Y0000123456789

Field description

This field identifies the area where the energy is coming from through its EIC Y-type code.

This field is mandatory.

Data Field (42) Rights holder

No	Field identifier	Description
42	Rights holder	The field identifies the market participant by a unique code (EIC X code) who is owner of, or has the right to use, the transmission rights in question.

Representation in electronic format
<holder_Rights_MarketParticipant.mRID>

Description of accepted values	Type	Length	Examples
EIC	Alphanumeric	Maximum 16	10X0000123456789

Field description

This field identifies the rights holder by a unique coded identification. Whenever rights are transferred, the rights holder is the transferor of the rights.

This field is mandatory.

Data Field (43) Transferee party (if applicable)

No	Field identifier	Description
43	Transferee party (if applicable)	The field identifies the market participant by a unique code (EIC X code) to whom the rights are being transferred or the interconnection trade responsible designated by the transferor (as designated in the rights holder attribute) to use the rights.

Representation in electronic format
<transferee_Rights_MarketParticipant.mRID>

Description of accepted values	Type	Length	Examples
EIC	Alphanumeric	16	10X0000123456789

Field description

This field identifies the transferee party by a unique coded identification. In certain cases, the transferee party also acts as interconnection trade responsible.

This field is mandatory in the case of transfers.

Data Field (44) Contract identification

No	Field identifier	Description
44	Contract identification	The field indicates the contract identification of the time series instance as assigned by the transmission capacity allocator, such as TSO or auction operator, or the OMP.

Representation in electronic format
<marketAgreement.mRID>

Description of accepted values	Type	Length	Examples
Capacity agreement identifications (CAIs)	Alphanumeric	Maximum 35	3105105CY601

Field description

This field provides the number that has been assigned by the transmission capacity allocator. It provides identification that uniquely identifies the allocation.

This field is mandatory.

Data Field (45) Contract type

No	Field identifier	Description
45	Contract type	The field indicates the contract type defining the conditions under which the rights were allocated and handled, such as daily auction, weekly auction, monthly auction, yearly auction or other.

Representation in electronic format
<marketAgreement.type>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes. A01 = Daily A02 = Weekly A03 = Monthly A04 = Yearly	Alphanumeric	3	A01

Field description

This field defines the conditions under which the rights were allocated and handled. The significance of this type is dependent on the in-area and out-area specific coded working methods.

The transmission capacity allocator responsible for the area in question defines the contract type to be used, for example daily auction, weekly auction, monthly auction, yearly auction, long-term contract.

This field is mandatory.

Data Field (46) Previous contract identification (if applicable)

No	Field identifier	Description
46	Previous contract identification (if applicable)	The field indicates the identification of a previous contract used to identify the transfer rights.

Representation in electronic format

<previous_MarketAgreement.mRID>

Description of accepted values	Type	Length	Examples
Capacity agreement identifications (CAIs)	Alphanumeric	Maximum 35	3105105CY601

Field description

This field indicates the previous identification that was used to identify the transfer rights. This is only applicable if there was a change in the information provided in Data Field (44) Contract identification.

Data Field (47) Measure unit quantity

No	Field identifier	Description
47	Measure unit quantity	The field indicates the unit of measure in which the quantity in the time series is expressed.

Representation in electronic format

<quantity_Measurement_Unit.name>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes.	Alphanumeric	Maximum 3	MWH

Field description

This field indicates the unit of measurement used for the quantities expressed within the time series.

This field is mandatory.

Data Field (48) Auction identification (if applicable)

No	Field identifier	Description
48	Auction identification (if applicable)	The field indicates the identification linking the capacity rights to a set of specifications created by the transmission capacity allocator, such as the TSO or the auction operator or the OMP.

Representation in electronic format

<auction.mRID>

Description of accepted values	Type	Length	Examples
Unique identification that clearly identifies the auction to which the bid is addressed	Alphanumeric	Maximum 35	AT-CH-M-BASE—-140801-01

Field description

This field provides the unique identification of the set of specifications that clearly defines the auction to which the capacity rights submitted by the capacity trader are to be re-auctioned.

Data Field (49) Currency (if applicable)

No	Field identifier	Description
49	Currency (if applicable)	The field indicates the currency in which the monetary amount is expressed.

Representation in electronic format

<currency_Unit.name>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes.	String	Maximum 3 ISO 4217	EUR

Field description

This field indicates the currency used for the monetary amount expressed within the time series.

This information is mandatory, if available.

Data Field (50) Measure unit price (if applicable)

No	Field identifier	Description
50	Measure unit price (if applicable)	The field indicates the unit of measure in which the price in the time series is expressed.

Representation in electronic format

<price_Measurement_Unit.name>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes.	Alphanumeric	Maximum 3	MWh

Field description

This field indicates the unit of measurement used for the price expressed within the time series (MW per unit, MWh per unit, etc.).

This information is mandatory, if available.

Data Field (51) Curve type (if applicable)

No	Field identifier	Description
51	Curve type (if applicable)	The field indicates the type of the curve that is being provided for the time series in question, such as variable sized block, or fixed sized block or point.

Representation in electronic format

<curveType>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes. A01 = Sequential fixed size blocks A02 = Points A03 = Variable sized blocs A04 = Overlapping breakpoints A05 = Non-overlapping breakpoints	Alphanumeric	Maximum 3	A01

Field description

This field represents the coded identification of the curve that is described in the period and interval class.

If the 'curve type' element is omitted in the XML instance, a default value of 'sequential fixed-size blocks' shall be understood. The sequential fixed-size blocks ('A01') curve is made of successive intervals of time (blocks) of constant duration (size), where the size of blocks is equal to the resolution of the period. The value of the quantity remains constant within each block.

This information is mandatory, if available.

8.6. Data fields related to period for primary allocation and secondary processes

Data Field (52) Time interval

No	Field identifier	Description
52	Time interval	The field indicates the date and time of the start and end of the reported period.

Representation in electronic format
<Period> <timeInterval> <start>
<Period> <timeInterval> <end>

Description of accepted values	Type	Length	Examples
ISO 8601 date format using UTC	Date and time	41	2026-03-01T13:00Z/2027-05-11T15:30Z

Field description

This field identifies the start and end date and time of the period in question. The start and end time is expressed in UTC.

There may be several period classes for a time series. The overall time interval covered by the period shall be within the complete rights time interval. The number of periods within a time series, as characterised by the resolution, must completely cover the period's time interval. If a time series is suppressed, the interval quantities are all zeroed out.

This field is mandatory.

Data Field (53) Resolution

No	Field identifier	Description
53	Resolution	The field indicates the resolution defining the number of periods that the time interval is divided (ISO 8601).

Representation in electronic format

<Period> <resolution>

Description of accepted values	Type	Length	Examples
The resolution is expressed in compliance with ISO 8601. For example, PT15M expresses a 15-minute resolution.	Date and time	PnYnMnDTnHnMnS	PT15M

Field description

This field identifies the number of periods that the time interval is divided into, where ‘nY’ expresses the number of years, ‘nM’ the number of months and ‘nD’ the number of days. The letter ‘T’ separates the date expression from the time expression and, after it, ‘nH’ identifies the number of hours, ‘nM’ the number of minutes and ‘nS’ the number of seconds.

This information defines the resolution of a single period. The time interval must contain a whole number of periods, as expressed by the resolution.

This field is mandatory.

8.7. Data fields related to interval for primary and secondary allocation processes

Data Field (54) Position

No	Field identifier	Description
54	Position	The field indicates the relative position of a period within an interval.

Representation in electronic format

<Period> <Point> <position>

Description of accepted values	Type	Length	Examples
The relative position must be expressed as a numeric integer value beginning with 1. All leading zeros	Integer	Maximum 6	1

must be suppressed. The maximum number of characters is 6. 1 2 3 … 999999			

Field description

This field provides the relative position of a period within an interval.

This field is mandatory, if available.

Data Field (55) Quantity

No	Field identifier	Description
55	Quantity	The field indicates the quantity that has been allocated in the primary auction as assigned to the nomination party for secondary rights.

Representation in electronic format

<Period> <Point> <quantity>

Description of accepted values	Type	Length	Examples
The maximum length of this information is 17 numeric characters (decimal mark included).	Numeric	Maximum 17	10.8

Field description

This field defines the quantity that has been assigned to the nomination party for the interval in question and that is expressed in the measurement unit. A decimal point value may be used to express values that are inferior to the defined unit of measurement. The decimal mark that separates the digits forming the integral part of a number from those forming the fractional part (ISO 6093) shall always be a period ('.'). All quantities are non-signed values.

In the case of unmatched bids ('unsuccessful bids') that do not result in a transaction and thus in allocated capacity, this field should be populated with '0' (zero).

The number of decimal places identifying the fractional part of the quantity depends on local market rules.

Data Field (56) Price amount (if applicable)

No	Field identifier	Description
56	Price amount (if applicable)	The field indicates the price expressed for each unit of quantity allocated through the primary allocation. The price is expressed for each unit of

		quantity resold or transferred on the secondary market.

Representation in electronic format
<Period> <Point> <price.amount>

Description of accepted values	Type	Length	Examples
The maximum length of this information is 17 numeric characters (decimal mark and sign included, if used).	Numeric ISO 6093	Maximum 17	1.8

Field description

This field indicates the price expressed for each unit, i.e. the price indicated in a resale document equal to or above which the quantity may be sold.

This information defines the price, expressed as price per unit of quantity, in compliance with the pricing scheme based on local market rules. The decimal mark that separates the digits forming the integral part of a number from those forming the fractional part (ISO 6093) shall always be a period ('.').

This field is mandatory, if available.

Data Field (57) Bid quantity (if applicable)

No	Field identifier	Description
57	Bid quantity (if applicable)	The field indicates the quantity that was in the original bid document.

Representation in electronic format
<secondaryQuantity>

Description of accepted values	Type	Length	Examples
The maximum length of this information is 17 numeric characters (decimal mark included).	Numeric ISO 6093	Maximum 17	1.8

Field description

This field defines the quantity that was requested for the interval in question and that is expressed in Data Field (47) Measurement unit quantity.

A decimal point value may be used to express values that are inferior to the defined unit of measurement. The decimal mark that separates the digits forming the integral part of a number from those forming the fractional part (ISO 6093) shall always be a period ('.'). All quantities are non-signed values. The number of decimal places identifying the fractional part of the quantity depends on local market rules.

This field is mandatory, if available.

Data Field (58) Bid price amount (if applicable)

No	Field identifier	Description
58	Bid price amount (if applicable)	The field indicates the original price expressed in the original bid or resale for each unit of quantity requested.

Representation in electronic format
<bidAmount_Price.amount>

Description of accepted values	Type	Length	Examples
The maximum length of this information is 17 numeric characters (decimal mark included).	Numeric ISO 6093	Maximum 17	1.8

Field description

This field reproduces the price, expressed in price per unit of quantity, requested in the original bid.

The decimal mark that separates the digits forming the integral part of a number from those forming the fractional part (ISO 6093) shall always be a period (‘.’).

This field is mandatory, if available.

8.8. Data fields related to reason for primary allocation and secondary processes

Data Field (59) Reason code (if applicable)

No	Field identifier	Description
59	Reason code (if applicable)	The field indicates the code providing the status of the allocation or the rights.

Representation in electronic format
<Reason> <code>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes. A75 = Rights status information	Alphanumeric	Maximum 3	A75

A71 = Linked bid rejected due to associated bid unsuccessful A72 = Original bid divided to permit acceptance A73 = Bid accepted A74 = Auction Status			

Field description

This field provides the reason code indicating the status of the rights identified. As many reason elements as necessary may be used. This information is provided at the time series level to give additional explanatory information.

This field is mandatory, if available.

Data Field (60) Reason text (if applicable)

No	Field identifier	Description
60	Reason text (if applicable)	The field indicates the textual explanation of the reason code.

Representation in electronic format

<Reason> <text>

Description of accepted values	Type	Length	Examples
If the code does not provide all the information to clearly identify the justification of the allocation, then textual information may be provided.	Alphanumeric	Maximum 512	

Field description

This field shall be used only if the reason code is insufficient to identify an error.

This field is mandatory, if available.

8.9. Data fields related to bid header document and bid document fields for organised marketplaces (applicable for secondary trading)

Data Field (61) Subject party

No	Field identifier	Description
61	Subject party	The field identifies the market participant by a unique code (EIC code) for whom the bid is being submitted.

Representation in electronic format

<Subject_MarketParticipant> <mRID>

Description of accepted values	Type	Length	Examples
EIC	Alphanumeric	16	10X1001A1001A450

Field description

This field identifies the party that is the capacity trader for whom the bids are being submitted. The codification scheme used for the coded identification is indicated by the coding scheme attribute.

This field is mandatory.

Data Field (62) Subject role

No	Field identifier	Description
62	Subject role	The field indicates the role of the subject party.

Representation in electronic format

<Subject_MarketParticipant> <marketRole.type>

Description of accepted values	Type	Length	Examples
Refer to the ENTSO-E code list for data interchange document for the valid list of codes. A29 = Capacity trader	Alphanumeric	Maximum 3	A29

Field description

This field identifies the role of the subject party. In this current implementation of ECAN (Capacity Allocation and Nomination System), the role shall always be ‘A29’ (capacity trader).

This field is mandatory.

Data Field (63) Divisible

No	Field identifier	Description
63	Divisible	The field indicates whether each element of the bid may be partially accepted or not.

Representation in electronic format

<divisible>

Description of accepted values	Type	Length	Examples
A01 = Yes A02 = No	Alphanumeric	Maximum 3	A01

Field description

This field indicates whether each element of the bid may be marginal. This means that the quantity allocated to each element of the bid may be any value between 0 and the quantity asked. If it is not divisible, the quantity may be either 0 or the quantity. This is only applicable to the last assessed bid. In the case of capacity auctions, if the ATC limit is reached, 'divisible' means that it may be reduced to the ATC limit and partially accepted.

This field is mandatory, if available.

Data Field (64) Linked bids identification (if applicable)

No	Field identifier	Description
64	Linked bids identification (if applicable)	The field indicates the unique identification associated with all linked bids.

Representation in electronic format

<linkedBidsIdentification>

Description of accepted values	Type	Length	Examples
Unique linked bid identification	Alphanumeric	Maximum 35	

Field description

This field identifies a set of bids that are linked together, signifying that they are either all accepted or all rejected. This identification is defined by the bidder and must be unique for a given auction. The linked bid identification is only provided if another bid is associated with the current bid. Both bids must be cross linked to be valid.

This field is mandatory, if available.

Data Field (65) Block bid

No	Field identifier	Description
65	Block bid	The field indicates that the values in the period constitute a block bid and that they cannot be changed.

Representation in electronic format

<blockBid>

Description of accepted values	Type	Length	Examples
A01 = Yes A02 = No	Alphanumeric	Maximum 3	A01

Field description

This field indicates that all the time intervals in the time series are to be considered as a whole and that they cannot be subdivided. The default value for this attribute is ‘A02’ (‘no’).

This field is mandatory, if available.

9. Data fields related to natural gas transportation contracts to be reported in Table 4

Technical and business requirements when submitting the transaction record

This chapter sets out the reporting requirements for reporting parties on how to populate the data fields included in Table 4 of the Annex to the REMIT Implementing Regulation when reporting transactions relating to wholesale energy products associated with the transportation of natural gas in the EU, pursuant to Article 3(b) of the REMIT Implementing Regulation. Table 4 shall be used for the reporting of transactions referring to both standard and non-standard gas transportation contracts.

The data fields included in Table 4 are expected to be populated according to the cardinality table below and the reporting requirements explained under the individual data fields. In addition, for further clarification, a non-exhaustive list of trading scenarios is available in Annex II to the TRUM.

In accordance with Article 13(4) of the REMIT Implementing Regulation, ACER has established the electronic formats for reporting transactions related to gas transportation contracts based on established industry standards by adopting for Table 4 the standard set out by Edig@s.

Cardinality table of the data fields included in Table 4

M = mandatory
M* = conditionally mandatory
— = not applicable

Field no.	Field name	Primary allocation	Secondary allocation	Unsuccessful bids
Common data for primary and secondary allocation processes				
1	Sender identification	M	M	M
2	Organised marketplace identification	M	M	M
3	Process identification	M	M	M
4	Type of gas	M*	M*	M*
5	Transportation transaction identification	M	M	M
6	Creation date and time	M	M	M
7	Auction open date and time	M*	M*	M*
8	Auction end date and time	M*	M*	M*
9	Product type	M	M	M
10	Transportation transaction type	M	M	M
11	Allocation mechanism	M*	M*	M*
12	Offer of additional capacity	M*	—	M*
13	Start date and time	M	M	M
14	End date and time	M	M	M
15	Offered capacity	M*	M*	M*
16	Capacity category	M*	—	M*
17	Linked auction ID for competing auctions	M*	M*	M*
Data for lifecycle reporting				
18	Action type	M	M	M

Data for quantity and price reporting				
19	Quantity	M	M	—
20	Measure unit	M	M	M
21	Currency	M	M	M
22	Total price	M	M	—
23	Fixed or floating reserve price	M*	—	M*
24	Reserve price	M*	M*	M*
25	Premium price	M*	M*	—
Data for identification of location and market participant				
26	**Error! Bookmark not defined.**	M	M	M
27	Bundling	M*	M*	M*
28	Direction	M	M	M
29	TSO 1 identification	M	M	M
30	TSO 2 Identification	M*	M*	M*
31	Market participant identification	M	M	M
32	Balancing group or portfolio code	M*	M*	M*
Data applicable only for secondary allocations				
33	Procedure applicable	—	M	M
34	Maximum bid amount	—	M*	M*
35	Minimum bid amount	—	M*	M*
36	Maximum quantity	—	M*	M*
37	Minimum quantity	M*	M*	M*
38	Price paid to TSO (underlying price)	—	M*	M*
39	Price the transferee pays to the transferor	—	M	—
40	Transferor identification	—	M	—
41	Transferee identification	—	M	—
Data fields applicable only for orders placed at auctions for primary allocations				
42	Bid ID	M*	—	M*
43	Auction round number	M*	—	M*
44	Bid price	M*	—	M*
45	Bid quantity	M*	—	M*

9.1. Data fields related to common data for primary and secondary allocation processes

Data Field (1) Sender identification

No	Field identifier	Description
1	Sender identification	The field identifies the RRM by its ACER registration code as the reporting entity of the document.

Representation in electronic format
<issuer_MarketParticipant.identification>

Description of accepted values	Type	Length	Examples
ACER code	Alphanumeric	12	A0643278W.EU

Field description

This field indicates the ACER registration code of the RRM sending the document.

The Edig@s message includes ‘standard header information’ and requires the indication of the coding scheme attribute. For ACER codes, it shall be equal to ‘ACE’.

Both the identification and the coding scheme are mandatory for primary and secondary allocations.

Data Field (2) Organised marketplace identification

No.	Field Identifier	Description
2	Organised marketplace identification	The field identifies the organised marketplace by a unique code where the capacity was offered.

Representation in electronic format
<organisedMarketPlace_MarketParticipant.identification>

Description of accepted values	Type	Length	Examples
ACER code EIC X	Alphanumeric	12 16	A0643278W.EU 10X1001A1001A450

Field description

This field identifies the OMP where the capacity was offered. This can be a booking platform ([23]) or an individual TSO platform.

If the allocation was executed on an OMP, this field must contain the ACER code, as reported in the 'List of organised marketplaces' published by ACER, or an EIC X-type code. For ACER codes, the coding scheme attribute shall be equal to 'ACE', while for EIC X-type codes it shall be equal to '305'.

Where the allocation procedure does not take place on an OMP (i.e. bilateral secondary allocation), this field shall be populated with the default value '21X-XXXXXXXXXXXY'.

Both the identification and the coding scheme are mandatory for primary and secondary allocations.

Data Field (3) Process identification

No	Field identifier	Description
3	Process identification	The field identifies the auction or other process as defined by the capacity allocating entity.

Representation in electronic format

<process_Transaction.identification>

Description of accepted values	Type	Length	Examples
Up to 35 alphanumerical digits	Alphanumeric	Up to 35	590825

Field description

This field identifies the specific capacity auction by a unique code.

The value reported for the population of this field shall match the relevant auction code, as indicated in any public information issued by the OMP.

Primary allocations

In the case of primary allocations, the code is uniquely assigned by the OMP that hosts the capacity allocation. The process identification shall be unique within a particular OMP, but the same code can also be used by other OMPs.

Secondary allocations

As indicated for primary allocations, the same applies in the case of secondary allocations occurring on an OMP. The field is also considered mandatory for bilateral secondary allocations (i.e. when the capacity has been allocated bilaterally outside of an OMP), such as shipper–shipper transactions. In such cases, the field shall be populated with the unique identification code of the allocation, as agreed bilaterally by the counterparties.

([23]) As defined in Commission Regulation (EU) 2017/459 of 16 March 2017 establishing a network code on capacity allocation mechanisms in gas transmission systems and repealing Regulation (EU) No 984/2013.

For bilateral transactions reported with values ‘OTC’ or ‘OTC_SUB’ (‘A03’ or ‘A06’, respectively) in Data Field (33) Procedure applicable, this field shall be populated with the default value ‘OTC’. In all other cases, the actual process ID would be required.

Data Field (4) Type of gas

No	Field identifier	Description
4	Type of gas	The field indicates the type of gas.

Representation in electronic format

<process_Transaction.taxonomy.energyProductType>

Description of accepted values	Type	Length	Examples
HC1 = High calorific LC1 = Low calorific	Alphanumeric	3	HC1

Field description

This field identifies the type of gas that the capacity allocation refers to. The value ‘HC1’ shall be populated for high calorific value gas, and ‘LC1’ for low calorific value gas.

The field is mandatory for allocations occurring via auctions.

Data Field (5) Transportation transaction identification

No	Field identifier	Description
5	Transportation transaction identification	The field indicates the unique identification number for the capacity allocation as assigned by the transmission capacity allocator e.g. TSO, auction operator or the OMP.

Representation in electronic format

<Transportation_Transaction> <identification>

Description of accepted values	Type	Length	Examples
Up to 35 digits	Alphanumeric	Up to 35	111-67A4552

Field description

This field indicates the unique identification code of the transportation transaction.

The field is mandatory for primary and secondary allocations.

Primary allocations

For primary allocations, the value reported in this field shall provide a unique code that clearly identifies the primary capacity allocation, as assigned by the transmission capacity allocator (e.g. the OMP).

In the case of a successful transaction (i.e. successful bid) that results in capacity being allocated to a market participant, the unique code that identifies the capacity allocation shall correspond to the identifier of the concluded transaction between the TSO and the 'successful market participant'.

In the case of an unsuccessful bid that does not result in allocated capacity, a unique code is still assigned by the transmission capacity allocator with the aim of identifying the bidding behaviour of the relevant market participant that submitted the unsuccessful bid (such a market participant may be referred to as an 'unsuccessful market participant') during the allocation process.

It is ACER's understanding that the TSO may generate the transportation transaction identification (for both successful and unsuccessful market participants) as follows:

Process identification reported in Data Field (3), followed by '-' (dash), followed by the EIC code of the relevant network user.

Secondary allocations

For secondary allocations, the value reported in this field provides a uniquely assigned identification number for the allocation made between the transferor and the transferee, as assigned by the transmission capacity allocator or as agreed between the balancing group(s) or shipper(s) for bilaterally agreed capacity allocations. The value reported in this field by the transferor shall thus be equal to the one reported by the transferee.

Data Field (6) Creation date and time

No	Field identifier	Description
6	Creation date and time	The field indicates the creation date and time of the transaction.

Representation in electronic format

<process_Transaction.transaction_DateTime.dateTime>

Description of accepted values	Type	Length	Examples
ISO 8601 date and time format using UTC	Date and time	Up to 30	2026-01-29T10:35:56Z

Field description

This field indicates the date and time of the execution of the transaction, i.e. the transaction timestamp. The field must reflect the actual time as accurately as possible, reported as a string representation of the ISO 8601 date and time format. The timestamp shall always be represented in UTC, thus expressed either in Zulu time, or in local time with the time zone offset indicated.

This field is mandatory for primary and secondary allocations.

Primary allocation

If the allocation occurs via an auction, this field shall reflect the time of the announcement of the auction results or any subsequent modifications or cancellations of the transaction. However, ACER is aware that reporting parties may sometimes not be in a position to know the exact time of the announcement of the auction results. In such cases, this field can be populated with the gate closure time of the auction. The same applies to auctions where bids were submitted by market participants bidding for the offered capacity, but no allocation took place.

Data Field (6) Creation date and time corresponds to the attribute <process_Transaction.transaction_DateTime.dateTime> in the Edig@s schema. In the schema, there is also the element <creationDateTime> available, which reflects the date and time at which the electronic report file was created but shall not be used to report the transaction timestamp specified in this field. With regard to the date and time information mentioned above, ACER understands that there may be a delay between the execution time of the transaction and the time of the xml file creation.

Secondary allocation

For secondary allocations, this field shall indicate the date and time when the two counterparties agreed on the conclusion of the transaction. The timestamp shall be rounded to the nearest minute in the UTC format (e.g. 2026-01-29T10:35Z).

Data Field (7) Auction open date and time

No	Field identifier	Description
7	Auction open date and time	The field indicates the date and time when an auction opens for bidding.

Representation in electronic format

<process_Transaction.auctionOpen_DateTime.dateTime>

Description of accepted values	Type	Length	Examples
ISO 8601 date and time format using UTC	Date and time	Up to 30	2026-01-29T10:35:56Z

Field description

This field indicates the date and time when the auction opened for bidding. Auction open date and time shall be expressed in the ISO 8601 date format using UTC.

The field is mandatory if the primary or secondary allocation occurs via an auction but not applicable if the allocation process does not involve an auction or a call for orders.

Data Field (8) Auction end date and time

No	Field identifier	Description
8	Auction end date and time	The field indicates the date and time when an auction closes.

Representation in electronic format
<process_Transaction.auctionEnd_DateTime.dateTime>

Description of accepted values	Type	Length	Examples
ISO 8601 date and time format using UTC	Date and time	Up to 30	2026-01-29T10:35:56Z

Field description

This field indicates the date and time when the auction closes for bidding, i.e. the gate closure. The auction end date and time shall always refer to the last point in time when a market participant can submit bids and when trading can occur. Auction end date and time are expressed in the ISO 8601 date format using UTC.

The field is mandatory for primary and secondary allocations occurring via auctions.

If the allocation process does not involve an auction (e.g. secondary allocations occurring outside an OMP) or a call for orders, this field is not applicable.

Data Field (9) Product type

No	Field identifier	Description
9	Product type	The field indicates the type of the product such as daily, weekly, or other.

Representation in electronic format
<productType.periodSpanCode>

Description of accepted values	Type	Length	Examples
ZEJ = Yearly standard capacity product ZEK = Quarterly standard capacity product ZEL = Monthly standard capacity product ZEM = Daily standard capacity product ZEN = Within-day standard capacity product ZES = Other/Non-standard capacity product ZET = Balance of month	Alphanumeric	3	ZEJ

Field description

This field indicates the type of the product that is being allocated.

For standard capacity products, the product type should be consistent with the definition set out in Commission Regulation (EU) 2017/459.

For non-standard capacity products, the product type shall be as defined by the OMP or as bilaterally agreed by the counterparties.

Data Field (10) Transportation transaction type

No	Field identifier	Description
10	Transportation transaction type	The field indicates the nature of the transportation transaction to be reported in accordance with current applicable industry standards as specified by gas network code on interoperability and data exchange.

Representation in electronic format

<process_Transaction.transactionCode>

Description of accepted values	Type	Length	Examples
ZSF = Primary market procedure ZSZ = Secondary market procedure ZSP = Capacity conversion ZSG = Capacity return ZTL = Buy-back	Alphanumeric	3	ZSF

Field description

The field identifies the nature of the relevant transportation transaction to be reported, according to the predefined values for this field.

For secondary allocations, the value ‘ZSZ’ shall be populated in this field. In such cases, Data Field (33) Procedure must also be populated.

Further examples of the reporting of the above-listed procedures are available in Annex II to the TRUM.

The field is mandatory for primary and secondary allocations.

Data Field (11) Allocation mechanism

No	Field identifier	Description
11	Allocation mechanism	The field indicates the mechanism applied for the capacity allocation by the transmission

		capacity allocator e.g. TSO, auction operator or the OMP.

Representation in electronic format
<allocationMechanism>

Description of accepted values	Type	Length	Examples
ZSW = Ascending clock auction ZSX = Uniform price auction ZSY = First come first served ZTD = Storage allocation ZTF = Pro-rata ZTA = Over-nomination ZTB = Open subscription window ZTK = Alternative allocation mechanism	Alphanumeric	3	ZSW

Field description

This field indicates the mechanism used by the transmission capacity allocator (e.g. TSO, auction operator or the OMP) to allocate the capacity.

Mechanisms related to over-nominations ('ZTA') and open subscription windows ('ZTB') shall only refer to the primary market procedure indicated as 'ZSF' in Data Field (10) Transportation transaction type.

In the case of secondary market procedures (reported with 'ZSZ' in Data Field (10)), this field is not considered applicable.

It is important to note that the alternative allocation mechanism ('ZTK') shall be understood as defined in Article 3(3) and Article 30(2) of Commission Regulation (EU) 2017/459.

The field is mandatory for primary allocations.

Data Field (12) Offer of additional capacity

No	Field identifier	Description
12	Offer of additional capacity	The field indicates open season, incremental auctions or other processes to determine the demand for an increase in capacity availability.

Representation in electronic format
<offerOfAdditionalCapacity.additionalCapacityType>

Description of accepted values	Type	Length	Examples
ZTC = Open season	Alphanumeric	3	ZTC

ZTG = Incremental capacity			

Field description

This field indicates whether the allocation procedure refers to the offer of additional capacity, such as open season or incremental capacity auctions.

In the case of secondary market procedures (reported with 'ZSZ' in Data Field (10)), this field is not considered applicable.

The field is considered applicable in cases where additional capacity is offered in the specific allocation process.

Data Field (13) Start date and time

No	Field identifier	Description
13	Start date and time	The field indicates the date and time of the start of the transportation transaction runtime.
Representation in electronic format		
<TimeIntervalType>		

Description of accepted values	Type	Length	Examples
ISO 8601 date and time format using UTC	Date and time	Up to 30	2026-01-29T08:00Z

Field description

This field indicates the start date and time of the transportation period ('transaction runtime' in the Edig@s schema).

Date and time shall be expressed as 'YYYY-MM-DDThh:mmZ'.

The field is mandatory for primary and secondary allocations.

Data Field (14) End date and time

No	Field identifier	Description
14	End date and time	The field indicates the date and time of the end of the transportation transaction runtime.
Representation in electronic format		
<TimeIntervalType>		

Description of accepted values	Type	Length	Examples
ISO 8601 date and time format using UTC	Date and time	Up to 30	2026-01-29T10:35Z

Field description

This field indicates the end date and time of the transportation period ('transaction runtime' in the Edig@s schema).

The date and time shall be expressed as 'YYYY-MM-DDThh:mmZ'.

The field is mandatory for primary and secondary allocations.

Data Field (15) Offered capacity

No	Field identifier	Description
15	Offered capacity	The field indicates the quantity of capacity available in the auction, expressed in the measure unit.
Representation in electronic format		
<offeredCapacity_Quantity.quantityAmount>		

Description of accepted values	Type	Length	Examples
Up to 32 numerical digits (decimal mark included) in the format xxxxx.yyyyy	Numeric	Up to 32	200.5

Field description

This field represents the total capacity offered in the specific allocation process (i.e. available capacity offered by the TSO in the auction). This implies that the offered capacity is specific to the allocation process and does not depend on the bidding activity of the market participants.

When reporting the value of the offered capacity in this field, the decimal mark that separates the digits forming the integral part of a number from those forming the fractional part (ISO 6093) shall always be a period ('.').

The measurement unit applicable to the offered capacity reported in this field shall be indicated in Data Field (20).

The field is mandatory for allocations occurring via auctions or call for orders procedures.

Data Field (16) Capacity category

No	Field identifier	Description
16	Capacity category	The field indicates the applicable capacity category.

Representation in electronic format

<process_Transaction.taxonomy.availabilityType>

Description of accepted values	Type	Length	Examples
Z04 = Available total firm capacity Z05 = Interruptible (booked) Z06 = Firm (booked) ZEQ = Freely allocable capacity ZER = Capacity with allocation restrictions and usage restrictions ZES = Restricted-allocable capacity ZET = Dynamically allocable capacity ZEU = Temperature related and restricted capacity ZEW = Published technical capacity ZFA = Available interruptible capacity ZFB = Available firm capacity ZFD = Available total interruptible capacity	Alphanumeric	3	Z06

Field description

This field identifies the specific type of capacity allocated based on the relevant allocation procedure.

'Capacity category' refers to the result of the allocation procedure (e.g. booked interruptible, booked firm capacity).

The field is mandatory for primary allocations occurring via auctions.

Data Field (17) Linked auction ID for competing auctions

No	Field identifier	Description
17	Linked auction ID for competing auctions	The field identifies other auction(s) against which the auction being reported is competing.

Representation in electronic format

<LinkedAuctionId>

Description of accepted values	Type	Length	Examples
Up to 35 alphanumerical digits	Alphanumeric	Up to 35	590825

Field description

This field shall identify any auction that is competing with the auction that is being reported and identified in Data Field (3) Process identification. The linked auction ID shall correspond to the code that is uniquely assigned by the OMP hosting the competing auction.

Auctions are considered as competing when competing capacity is being allocated. Competing capacity is defined by Commission Regulation (EU) 2017/459 as 'capacity for which the available capacity in one of the concerned auctions cannot be allocated without fully or partially reducing the available capacity in the other concerned auction'.

The value reported for the population of this field shall match the relevant auction code, as indicated in any public information issued by the OMP hosting the competing auction.

The field is mandatory in the case of competing auctions.

9.2. Data fields related to data for lifecycle reporting

Data Field (18) Action type

No	Field identifier	Description
18	Action type	The field indicates the status code of the report to be reported in accordance with current applicable industry standards as specified in gas network code on interoperability and data exchange.

Representation in electronic format

<process_Transaction.action_Status.statuscode>

Description of accepted values	Type	Length	Examples
62G = Active 63G = Cancelled 66G = Changed 75G = Correction	Alphanumeric	3	62G

Field description

This information provided in this field indicates the status of the document.

The sender shall always identify the status of the document according to the following action types.

62G = Active. The report is valid and has never been updated.

63G = Cancelled. The report is not valid anymore as the transaction has been terminated or cancelled before the period runtime starts.

66G = Changed. The report initially submitted had to be modified due to a business decision (e.g. modification of the delivery profile).

75G = Correction. The report initially sent had an error and thus had to be corrected.

The field is mandatory for primary and secondary allocations.

9.3. Data fields related to data for quantity and price reporting

Data Field (19) Quantity

No	Field identifier	Description
19	Quantity	The field indicates the total number of units allocated with the transportation transaction as expressed in the measure unit.

Representation in electronic format

<contract_Quantity.quantityAmount>

Description of accepted values	Type	Length	Examples
Up to 32 numerical digits (decimal mark included) in the format xxxxx.yyyy	Numeric	Up to 32	20.5

Field description

This field identifies the quantity or capacity (in energy per unit of time) for the individual transaction reported, i.e. the contract size, not the total allocated quantity.

The value that shall be reported in this field is the energy per time unit (e.g. the number of kilowatt-hours per hour (kWh/h)), expressed in the measure unit indicated in Data Field (20).

In the case of unsuccessful bids that do not result in allocated capacity, this field shall be populated with the value ‘0’ (zero).

The maximum length of this information is 32 numeric characters (decimal mark included). All leading zeros are to be suppressed. The number of decimal places identifying the fractional part of the quantity depends on local market rules. A decimal point value may be used to express values that are inferior to the defined unit of measurement. The decimal mark that separates the digits forming the integral part of a number from those forming the fractional part (ISO 6093) shall always be a period (‘.’).

The field is mandatory for primary and secondary allocations.

Data Field (20) Measure unit

No	Field identifier	Description
20	Measure unit	The field indicates the unit of measurement used for all amounts reported.

Representation in electronic format

<quantity_measureUnit.code>

Description of accepted values	Type	Length	Examples
KW1 = kilowatt-hour per hour (kWh/h) KW2 = kilowatt-hour per day (kWh/d) HM1 = million cubic meters per hour HM2 = million cubic meters per day TQH = thousand cubic meters per hour TQD = thousand cubic meters per day MQ6 = normal cubic meters per hour MQ7 = normal cubic meters per day KWH = kilowatt-hour (kWh) GWH = gigawatt-hour (GWh)	Alphanumeric	3	KW1

Field description

This field identifies the unit of measurement used for the quantity information reported in Data Fields (15), (19), (34), (35), (36), (37) and (45). All the quantity information reported for the transaction under the abovementioned data fields shall be expressed in the same unit of measurement.

In the case of allocations concluded on an OMP, the value reported in this field shall correspond to the unit of measurement as advertised by the OMP.

The field is mandatory for primary and secondary allocations.

Data Field (21) Currency

No	Field identifier	Description
21	Currency	The field indicates the currency in which all monetary amounts reported are expressed.

Representation in electronic format

<currency.code>

Description of accepted values	Type	Length	Examples
EUR = euro EUX = euro cent CHF = Swiss franc CHX = centime CZK = Czech koruna DKK = Danish krone DKX = øre GBP = pound sterling GBX = penny sterling HUF = Hungarian forint ISK = Icelandic króna NOK = Norwegian krone PLN = Polish zloty PLX = grosz RON = Romanian new leu ROX = ban SEK = Swedish krona USD = US dollar USX = US cent	Text	3	EUR

Field description

This field identifies the currency in which the monetary amounts reported in Data Fields (22), (23), (24), (25), (38), (39) and (44) are expressed, using the smallest denomination in the currency system. All monetary amounts reported for the transaction under the abovementioned data fields shall be expressed in the same currency indicated in Data Field (21).

The price shall be expressed in and consistently reported as price currency per measurement unit per product type, as defined in Data Field (9). This is based on the understanding that the product type identified in Data Field (9) predetermines whether the price is reported per runtime or not.

For example, the transaction report could contain the following information.

- Data Field (20) Measure unit = MWh/h;
- Data Field (21) Currency = EUR;
- Data Field (9) Product type = ZEM (daily standard capacity product);
- Data Field (22) Total price (or whichever price field) = 40;
- Data Field (45) Bid quantity = 10.

This would mean that the total price equals 40 €/MWh/h/day, while the bid quantity equals 10 MWh/h.

The abovementioned logic for the measure unit and price currency shall be considered applicable to all types of price or quantity information included in the record, except for Data Field (38) Price paid to

TSO (underlying price) and Data Field (39) Price the transferee pays to the transferor (both of which are to be expressed in kWh/h).

In the case of allocations concluded on an OMP, the value reported in this field should correspond to the unit of measurement as advertised by the auction platform.

If needed, ACER recommends using the last available European Central Bank foreign exchange reference rate valid for the day of the execution of the transaction for currency conversion.

The field is mandatory for primary and secondary allocations.

Data Field (22) Total price

No	Field identifier	Description
22	Total price	The field indicates the reserve price at time of the auction plus auction premium or regulated tariff in case of other allocation mechanism than auction. The price shall be specified as the total price per unit and the total contract value.

Representation in electronic format
<total_Price.priceAmount>
<contract_Price.priceAmount>
<unit_Price.priceAmount>

Description of accepted values	Type	Length	Examples
Up to 32 numerical digits (decimal mark included) in the format xxxxx.yyyyy	Numeric	Up to 32	1.8

Field description

This field indicates the total price of the capacity allocated in the primary or secondary allocation. In the case of allocation of bundled capacity, each TSO should report the relevant individual share of the price of the transaction. The individual contributions to the price of those transactions are matched through Data Field (5) Transportation transaction identification.

The price reported in this field shall be expressed in the currency reported in Data Field (21).

The maximum length of the information reported in this field is 32 numeric characters (decimal mark included). All leading zeros are to be suppressed.

It is important to note that the reported total price value should contain both:

- the total price for one unit of the contracted capacity, in the unit of measurement reported in Data Field (22), which shall be equal to the sum of Data Fields (24) and (25); and
- the total price for the total volume of the contracted capacity per network user (i.e. the total contract value).

It is ACER's understanding that, in some cases, it is possible to have a zero ('0') reserve price under the tariff methodologies, for example for in-country points or points connected to storage facilities. In such cases, if the auction ends without a premium, the total price reported in this field would also be equal to zero.

The field is mandatory for primary and secondary allocations.

Data Field (23) Fixed or floating reserve price

No	Field identifier	Description
23	Fixed or floating reserve price	The field indicates the type of the reserve price.

Representation in electronic format

<reserve_Price.priceCode>

Description of accepted values	Type	Length	Examples
Z01 = Measurement fee Z07 = Fixed price Z08 = Floating price	Alphanumeric	3	Z07

Field description

This field qualifies the type of the reserve price reported in Data Field (24) Reserve price. This implies that the field is always mandatory if Data Field (24) is populated in the case of primary allocations.

Data Field (24) Reserve price

No	Field identifier	Description
24	Reserve price	The field indicates the reserve price for the auction.

Representation in electronic format

<reserve_Price.priceAmount>

Description of accepted values	Type	Length	Examples
Up to 32 numerical digits (decimal mark included) in the format xxxxx.yyyyy	Numeric	Up to 32	1.8

Field description

This field indicates the reserve price for the auction, if applicable. In the case of bundled capacity, each TSO should report its relevant individual share of the price of the transaction.

The price reported in this field shall be expressed in the currency reported in Data Field (21) per unit of measurement, as indicated in Data Field (20).

The field is mandatory for primary allocations and secondary allocations occurring via auctions where a reserve price applies.

Data Field (25) Premium price

No	Field identifier	Description
25	Premium price	The field indicates the premium price for the auction.
Representation in electronic format		
<premium_Price.priceAmount>		

Description of accepted values	Type	Length	Examples
Up to 32 numerical digits (decimal mark included) in the format xxxxx.yyyyy	Numeric	Up to 32	1.8

Field description

This field indicates the additional amount on top of the reserve price (i.e. the premium price), as agreed between the TSO and the market participant. In the case of bundled capacity, each TSO should report its relevant individual share of the premium of the transaction.

The price reported in this field shall be expressed in the currency reported in Data Field (21) per unit of measurement, as indicated in Data Field (20).

The maximum length of this information is 32 numeric characters (decimal mark included). All leading zeros are to be suppressed.

The field is mandatory for primary and secondary allocations occurring via auctions where a premium applies.

9.4. Data fields related to data for identification of location and market participant

Data Field (26) Network point identification

No	Field identifier	Description
26	Network point identification	The field identifies the network point within a network system according to the EIC code.

Representation in electronic format
<process_Transaction.connectionPoint.identification>

Description of accepted values	Type	Length	Examples
EIC Y EIC Z EIC W	Alphanumeric	16	10Y0000123456789

Field description

This field identifies, by its EIC (type Y, Z or W), the network point that the allocated capacity refers to.

For the validity of the EIC code adopted, reporting parties are invited to refer to the identification code registry provided by ENTSO-E ([24]).

In the schema, this field requires the indication of the coding scheme attribute as well. For EIC codes, the coding scheme attribute shall be equal to '305'.

The field is mandatory for primary and secondary allocations.

Data Field (27) Bundling

No	Field identifier	Description
27	Bundling	The field indicates the specification of bundling.

Representation in electronic format
<process_Transaction.capacityType.code>

Description of accepted values	Type	Length	Examples
ZEO = Bundled capacity ZEP = Unbundled capacity	Alphanumeric	3	ZEO

Field description

This field indicates the specification of bundling. The value 'ZEO' shall be used for bundled and the value 'ZEP' for unbundled capacity.

The field is mandatory for primary and secondary allocations occurring via auctions.

([24]) See https://www.entsoe.eu/data/energy-identification-codes-eic/eic-approved-codes/.

Data Field (28) Direction

No	Field identifier	Description
28	Direction	The field indicates the specification of direction.

Representation in electronic format

<direction.gasDirectionCode>

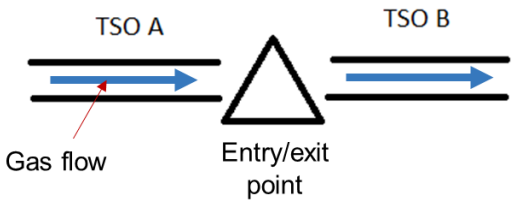

Description of accepted values	Type	Length	Examples
Z02 = Input quantity Z03 = Output quantity	Alphanumeric	3	Z02

Field description

This field specifies the direction of the transportation capacity in relation to the transmission system operated by the responsible TSO reported in Data Field (29). The TSO sells capacity with a direction in both bundled and unbundled capacity.

The indication of the direction to be reported in this field shall represent the direction of the gas flow in respect of the responsible TSO reported in Data Field (29).

For bundled capacity, the direction reported in this field shall represent the TSO's side. This implies that, in the case of allocated bundled capacity with direction from TSO A to TSO B (see figure below), this field is expected to be populated with 'Z03' when TSO A is identified in Data Field (29) TSO1 identification.

The field is mandatory for primary and secondary allocations.

Data Field (29) TSO 1 identification

No	Field identifier	Description
29	TSO 1 identification	The field identifies the TSO for which the data reporting is made.

Representation in electronic format

<process_Transaction.responsibleTso_MarketParticipant.identification>

Description of accepted values	Type	Length	Examples
ACER code EIC	Alphanumeric	12 16	A0643278W.EU 10X0000123456789

Field description

This field identifies the TSO that is responsible for the allocated capacity. The responsible TSO shall be identified by a unique identification code, either an ACER code or an EIC code that shall correspond to one of the TSO's registration codes available in CEREMP.

In the case of primary allocations, this field indicates the TSOs on whose behalf the data reporting is done.

In the schema, this field requires the indication of the coding scheme attribute as well. For EIC codes, the coding scheme attribute shall be equal to '305'. For ACER codes, it shall be equal to 'ACE'.

The field is mandatory for primary and secondary allocations.

Data Field (30) TSO 2 identification

No	Field identifier	Description
30	TSO 2 identification	The field identifies the counter TSO.

Representation in electronic format

<process_Transaction.adjacentTso_MarketParticipant.identification>

Description of accepted values	Type	Length	Examples
ACER code EIC	Alphanumeric	12 16	A0643278W.EU 10X0000123456789

Field description

The field identifies the counter TSO by a unique identification code, either an ACER code or an EIC code.

In the schema, this field requires the indication of the coding scheme attribute as well. For EIC codes, the coding scheme attribute shall be equal to '305'. For ACER codes, it shall be equal to 'ACE'.

This field is mandatory for primary allocations only in the case of allocation of bundled capacity (i.e. if Data Field (27) is populated with 'ZEO').

For secondary allocations of bundled capacity, this information shall be included only if available to the reporting parties.

Data Field (31) Market participant identification

No	Field identifier	Description
31	Market participant identification	The field identifies the market participant to which the capacity is assigned for primary allocation. For secondary allocation the field should identify the transferor or the transferee on whose behalf the data reporting is made.

Representation in electronic format

<primary_MarketParticipant.identification>

Description of accepted values	Type	Length	Examples
ACER code EIC X	Alphanumeric	12 16	A0643278W.EU 10X1001A1001A450

Field description

This field identifies, by its unique identification code, the market participant the capacity is assigned to.

The identification code of the market participant reported in this field shall correspond to one of the market participants' registration codes available in CEREMP.

In the schema, this field requires the indication of the coding scheme attribute as well. For EIC codes, the coding scheme attribute shall be equal to '305'. For ACER codes, it shall be equal to 'ACE'.

In the case of primary allocations or allocations occurring via auctions, this field shall also be populated for unsuccessful market participants, i.e. those market participants that inserted a bid but did not succeed in obtaining allocated capacity.

In the case of secondary allocation occurring outside an OMP, this field shall be populated with the market participant on whose behalf the report is sent. The two legs of these transactions shall be matched via the transportation transaction identification provided by both counterparties in Data Field (5).

The field is mandatory for primary and secondary allocations.

Data Field (32) Balancing group or portfolio code

No	Field identifier	Description
32	Balancing group or portfolio code	The field indicates the balancing group (or balancing groups in case of bundled products) to which the shipper belongs, or the portfolio code used by the shipper if a balancing group is not applicable.

Representation in electronic format

<primary_MarketParticipant.account.internalAccount>

Description of accepted values	Type	Length	Examples
TSO-managed code (ZSO) EIC	Alphanumeric	Up to 35 16	10X0000123456789

Field description

This field indicates the balancing group (or balancing groups in the case of bundled products) to which the shipper belongs, or the portfolio code used by the shipper if a balancing group is not applicable.

The internal account (i.e. identification) of the shipper or the balancing group account, assigned by the responsible TSO identified in Data Field (29), shall be reported in this field.

In the schema, this field requires the indication of the coding scheme attribute as well. For a TSO-managed code (IS-U code), the coding scheme attribute shall be equal to 'ZSO'. For EIC codes, the coding scheme attribute shall be equal to '305'.

The field is mandatory for both primary and secondary allocations only where balancing group portfolio or accounts apply.

9.5. Data fields related to data applicable only for secondary allocations

Data Field (33) Procedure applicable

No	Field identifier	Description
33	Procedure applicable	The field indicates the applicable procedure.
Representation in electronic format		
<process_Transaction.secondaryMarket_Procedure.procedureCode>		

Description of accepted values	Type	Length	Examples
A01 = CFO; call for orders for assignment A02 = FCFS; first come first served for assignment A03 = OTC; over the counter for assignment A04 = CFO_SUB; call for orders for subletting / transfer of use A05 = FCFS_SUB; first come first served for subletting / transfer of use	Alphanumeric	3	A01

A06 = OTC_SUB; over the counter for subletting / transfer of use			

Field description

This field identifies the specific secondary allocation procedure.

The field is only applicable in the case of secondary market allocations; hence, it is the responsibility of the involved market participants to determine the procedure.

The field is mandatory for secondary allocations.

Data Field (34) Maximum bid amount

No	Field identifier	Description
34	Maximum bid amount	The field indicates the maximum amount the transferee would be willing to offer, expressed in the currency per measure unit.

Representation in electronic format

<maximumBid_Price.priceAmount>

Description of accepted values	Type	Length	Examples
Up to 32 numerical digits (decimal mark included) in the format xxxxx.yyyyy	Numeric	Up to 32	1.8

Field description

This field indicates the maximum price the transferee is willing to pay when participating in a call for orders procedure.

The value reported in this field shall be expressed in the currency reported in Data Field (21) per the unit of measurement as expressed in Data Field (20).

The maximum length of this information is 32 numeric characters (decimal mark included). All leading zeros are to be suppressed. The decimal mark that separates the digits forming the integral part of a number from those forming the fractional part (ISO 6093) shall always be a period (‘.’).

The field is mandatory only for call for orders procedures, i.e. when Data Field (33) is populated with ‘A01’.

Data Field (35) Minimum bid amount

No	Field identifier	Description
35	Minimum bid amount	The field indicates the minimum amount the transferor would be willing to offer, expressed in the currency per measure unit.

Representation in electronic format
<minimumBid_Price.priceAmount>

Description of accepted values	Type	Length	Examples
Up to 32 numerical digits (decimal mark included) in the format xxxxx.yyyyy	Numeric	Up to 32	1.8

Field description

This field indicates the minimum price the transferor is willing to accept within a call for orders procedure.

The value reported in this field shall be expressed in the currency reported in Data Field (21) per the unit of measurement as expressed in Data Field (20).

The maximum length of this information is 32 numeric characters (decimal mark included). All leading zeros are to be suppressed. The decimal mark that separates the digits forming the integral part of a number from those forming the fractional part (ISO 6093) shall always be a period (‘.’).

The field is mandatory only for call for orders procedures, i.e. when Data Field (33) is populated with ‘A01’.

Data Field (36) Maximum quantity

No	Field identifier	Description
36	Maximum quantity	The field indicates the maximum quantity the transferee/transferor would be willing to acquire/sell on creating the trade proposal.

Representation in electronic format
<maximumBid_Quantity.quantityAmount>

Description of accepted values		**Type**	**Length**	**Examples**
Up to 32 numerical digits (decimal mark included) in the format xxxxx.yyyyy		Numeric	Up to 32	1.8

Field description

This field represents the maximum quantity the transferee/transferor would be willing to acquire/sell when creating the trade proposal within a call for orders procedure.

The maximum length of this information is 32 numeric characters (decimal mark included). All leading zeros are to be suppressed. The decimal mark that separates the digits forming the integral part of a number from those forming the fractional part (ISO 6093) shall always be a period ('.').

All quantities are unsigned values. The value reported in this field shall be expressed in the unit of measurement reported in Data Field (20).

The field is mandatory only for call for orders procedures, i.e. when Data Field (33) is populated with 'A01'.

Data Field (37) Minimum quantity

No	Field identifier	Description
37	Minimum quantity	The field indicates the minimum quantity the transferee/transferor would be willing to acquire/sell on creating the trade proposal.

Representation in electronic format

<minimumBid_Quantity.quantityAmount>

Description of accepted values	Type	Length	Examples
Up to 32 numerical digits (decimal mark included) in the format xxxxx.yyyyy	Numeric	Up to 32	1.8

Field description

This field represents the minimum quantity the transferee/transferor would be willing to acquire/sell when creating the trade proposal within a call for orders procedure. The field is thus mandatory for call for orders procedures, i.e. when Data Field (33) is populated with 'A01'. Furthermore, this field is expected to be populated in reports for primary capacity allocations occurring via uniform-price auctions.

This attribute may be used in the case of secondary market transactions but also in the case of primary allocations with uniform-price auctions, i.e. when Data Field (11) is populated with 'ZSX'.

The maximum length of this information is 32 numeric characters (decimal mark included). All leading zeros are to be suppressed. The decimal mark that separates the digits forming the integral part of a number from those forming the fractional part (ISO 6093) shall always be a period ('.').

All quantities are unsigned values. The value reported in this field shall be expressed in the capacity unit reported in Data Field (20).

The field is mandatory only for call for orders procedures, i.e. when Data Field (33) is populated with 'A01'.

Data Field (38) Price paid to TSO (Underlying Price)

No	Field identifier	Description
38	Price paid to TSO (underlying price)	The field indicates the price paid to the TSO when there is an assignment, expressed in the currency per measure unit which must be kWh/h.

Representation in electronic format
<underlyingTso_Price.priceAmount>

Description of accepted values	Type	Length	Examples
Up to 32 numerical digits (decimal mark included) in the format xxxxx.yyyyy	Numeric	Up to 32	1.8

Field description

This field indicates the price paid to the TSO. It shall be populated when there is an underlying price to be paid to the TSO in the secondary allocation (e.g. when the shipper has to pay the TSO a price in the first instance for capacity booking). The field is only applicable in the case of secondary market allocations; hence, it is the responsibility of the involved market participants to determine the price.

The underlying price is the price that shipper 1 pays to the TSO in the first instance for capacity booking (before the transaction on the secondary market takes place).

The maximum length of this information is 32 numeric characters (decimal mark included). All leading zeros are to be suppressed. The decimal mark that separates the digits forming the integral part of a number from those forming the fractional part (ISO 6093) shall always be a period (‘.’).

The price in this field shall always be reported in price per kWh/h, expressed in the currency reported in Data Field (21) Currency, with ‘KW1’ indicated in Data Field (20) Measure unit.

The field is mandatory if the secondary market procedure is call for orders, first come first serve or over the counter, reported in Data Field (33) as ‘A01’, ‘A02’ or ‘A03’, respectively.

Data Field (39) Price the transferee pays to the transferor

No	Field identifier	Description
39	Price the transferee pays to the transferor	The field indicates the price the transferee pays to the transferor, expressed in the currency per measure unit which must be kWh/h.

Representation in electronic format
<transfer_Price.priceAmount>
<transfer_PriceFormula>

Description of accepted values	Type	Length	Examples
For price: Up to 32 numerical digits (decimal mark included) in the format xxxxx.yyyyy **For formula:** Up to 1000 alphanumerical digits	Numeric Alphanumeric	Up to 32 Up to 1000	1.8

Field description

This field represents the price the transferee pays to the transferor in the secondary allocation (i.e. the price per unit of measurement of the transaction).

The price the transferee pays to the transferor may also be expressed and reported using a price formula or a fixing index. For this purpose, the schema element *Transfer_PriceFormula* shall be used.

The price or price formula in this field shall always be reported in price per kWh/h, expressed in the currency reported in Data Field (21) Currency, with 'KW1' indicated in Data Field (20) Measure unit.

The maximum length of this information is 32 numeric characters (decimal mark included). All leading zeros are to be suppressed. The decimal mark that separates the digits forming the integral part of a number from those forming the fractional part (ISO 6093) shall always be a period ('.').

This field is mandatory for secondary allocations.

Data Field (40) Transferor identification

No	Field identifier	Description
40	Transferor identification	The field identifies the market participant giving up the capacity by a unique code.

Representation in electronic format

<transferor_MarketParticipant.identification>

Description of accepted values	Type	Length	Examples
ACER code EIC X	Alphanumeric	12 16	A0643278W.EU 10X1001A1001A450

Field description

This field identifies the market participant that is selling the capacity in the secondary allocation (i.e. transferor). The transferor shall be identified by its ACER registration code or the EIC X-type code as registered in CEREMP.

In the schema, this field requires the indication of the coding scheme attribute as well. For EIC codes, the coding scheme attribute shall be equal to '305'. For ACER codes, it shall be equal to 'ACE'.

The field is mandatory only for secondary allocations.

Data Field (41) Transferee identification

No	Field identifier	Description
41	Transferee identification	The field identifies the market participant receiving the capacity by a unique code.

Representation in electronic format

<transferee_MarketParticipant.identification>

Description of accepted values	Type	Length	Examples
ACER code EIC X	Alphanumeric	12 16	A0643278W.EU 10X1001A1001A450

Field description

This field identifies the market participant that is buying the capacity in the secondary allocation (transferee). The transferee shall be identified by their ACER registration code or EIC X-type code, as registered in CEREMP.

In the schema, this field requires the indication of the coding scheme attribute as well. For EIC codes, the coding scheme attribute shall be equal to '305'. For ACER codes, it shall be equal to 'ACE'.

The field is mandatory only for secondary allocations.

9.6. Data fields applicable only for orders placed at auctions for primary allocations

Data Field (42) Bid ID

No	Field identifier	Description
42	Bid ID	The field indicates the numerical identifier of the bid as assigned by the organised marketplace.

Representation in electronic format

<Bid> <identification>

Description of accepted values	Type	Length	Examples
Up to 35 alphanumerical digits	Alphanumeric	Up to 35	8552448

Field description

This field identifies the unique identification code assigned by the transmission capacity allocator (e.g. TSO, auction operator or the OMP) to each bid submitted in the allocation procedure.

The code should be unique within the auction reported and is mandatory for primary auction allocations.

This field is also considered applicable in cases where the bid was submitted by a market participant in the primary allocation but did not result in allocated capacity.

Data Field (43) Auction round number

No	Field identifier	Description
43	Auction round number	The field indicates an integer that increments every time an auction achieves no result and is re-run with different parameters – starting at 1. To be left blank in case of auctions without binding rounds, e.g. day-ahead auctions.
Representation in electronic format		
<AuctionRound_Sequence> <position>		

Description of accepted values	Type	Length	Examples
An integer value starting with 1. 1 2 3 … 999	Integer	Up to 3	1

Field description

This field identifies the specific sequential identifier assigned by the OMP within the allocation process.

It is ACER's understanding that each auction round can impact the final price for transmission capacity. Accordingly, all matched and unmatched orders that were taken into consideration for the calculation of an auction round need to be reported.

The auction round number is an integer ([25]) that increments every time an auction achieves no result and is rerun with different parameters.

The starting value of an auction round number is always 1. In an ascending clock auction, this is a sequential value starting from 1 that is assigned by the OMP. In the case of auctions without bidding rounds (e.g. uniform-price auctions such as day-ahead auctions), this field shall be populated with '1'.

The field is mandatory for primary allocations occurring via auctions.

Data Field (44) Bid price

No	Field identifier	Description
44	Bid price	The field indicates the price bid for each unit of capacity excluding the reserve price, expressed in the currency and measure unit.

Representation in electronic format

<bid_Price.priceAmount>

Description of accepted values	Type	Length	Examples
Up to 32 numerical digits (decimal mark included) in the format xxxxx.yyyyy	Numeric	Up to 32	1.8

Field description

This field indicates the price associated with the bid identified in Data Field (42) for each unit of capacity, excluding the reserve price. The field reflects the price at the given round in the case of an auction.

The value reported in this field shall be expressed in the currency reported in Data Field (21) per measure unit as indicated in Data field (20).

The maximum length of this information is 32 numeric characters (decimal mark included). All leading zeros are to be suppressed. The decimal mark that separates the digits forming the integral part of a number from those forming the fractional part (ISO 6093) shall always be a period ('.').

The field is mandatory for primary allocations occurring via auctions.

Data Field (45) Bid quantity

No	Field identifier	Description

([25]) An integer is a number that is written without a fractional component (for example, 21, 4, and 204 are integers; 9.75 and 5½ are not integers).

45	Bid quantity	The field indicates the quantity being bid for, expressed in the measure unit.

Representation in electronic format

<bid_Quantity.quantityAmount>

Description of accepted values	Type	Length	Examples
Up to 32 numerical digits (decimal mark included) in the format xxxxx.yyyyy	Numeric	Up to 32	1.8

Field description

This field indicates the quantity submitted by the market participant (network user) during the relevant auction round in the bid identified in Data Field (42) expressed in the unit of measurement reported in Data Field (20).

If, during an auction, a minimum value and a maximum value were given by the bidder, the maximum value should be reported as the bid quantity.

The maximum length of this information is 32 numeric characters (decimal mark included). All leading zeros are to be suppressed. The decimal mark that separates the digits forming the integral part of a number from those forming the fractional part (ISO 6093) shall always be a period (‘.’).

The field is mandatory for primary allocations occurring via auctions.

10. List of annexes

Annex I: Guidance on reporting lifecycle events

Annex II: Examples of transaction reporting

Annex III: Guidance on reporting LNG market and trade data
